ACKNOWLEDGMENTS

Preparation of this edition was
under the direction of
William Lerner
Chief, Statistical Compendia Staff

The bicentennial edition of *Historical Statistics of the United States* is the third in the series of volumes inaugurated in 1949. In both form and content, the bicentennial edition has drawn heavily from, and built upon, the two prior editions. Both the first volume, *Historical Statistics of the United States, 7789 to 1945,* issued in 1949, and the second volume, *Historical Statistics of the United States, Colonial Times to 1957,* issued in 1960, were prepared by the Bureau of the Census with the cooperation of the Social Science Research Council (SSRC). Although the SSRC did not participate in the preparation of the bicentennial edition, its cooperation in the first two volumes was invaluable in establishing those volumes as the basis for continuing work in the field of historical statistics, Similarly, the many individuals and agencies who made important and distinctive contributions to the first two volumes were instrumental in the preparation of the present one. Immediately following the table of contents, therefore, are reprinted the "official roster and credits" pages from the first two volumes. Also, incorporated within the "Acknowledgments for Chapter Contributions," under the title of each edition, are the credits to contributors as they appeared in the first two volumes.

Analytical review and editing of text tables was primarily the responsibility of **Helen** E. Teir, Assistant Chief, Statistical Compendia Staff, Data User Services Division. During the period January 1972 to June 1973, **Elma D.** Beynon was primarily responsible for obtaining the cooperation and assistance of the many subject consultants and for immediate supervision of compilation operations. Suzanne **L. Worth** assisted **Mrs.** Beynon and, from July 1973 to November 1974, was responsible for working with consultants and for supervision of the technical and clerical staff. Alma **L.** Butler, assisted by Kay Swenson, was responsible for final editing and preparation of manuscript for the printer. The Census Library, **Dorothy W.** Kaufman, Chief, also lent valuable assistance.

The cooperation of the many contributors to this volume and to the prior editions is gratefully acknowledged. Following the practice established by the prior editions, every data series shown in this volume is, to the extent possible, specifically identified by source as to issuing agency and/or individual author, publication title, publisher, and date of issue. Frequently all five items are shown; frequently addlitional information is given.

Except for material specified in source citations as "copyright," the tables and text in this volume may be reproduced at will. Appropriate reference to this volume (see citation below) for material reproduced would be appreciated since it may be helpful to users of such material. Permission to reproduce copyrighted material should be obtained directly from the copyright owner.

Part 1—Detailed Contents

Numbers in parentheses following subjects are series numbers]

Chapter *Page*

Acknowledgments for Chapter Contributions---------- viii

Introduction---------- xi

A. Population---------- 1

Area and population (A 1–22)—Sex, race, and age (A 23–42 and A 91–104)—Urban and rural places and population (A 43–90)—Nativity (A 105–142)—Median age (A 143–159)—Marital status (A 160–171)—Regions (A 172–194)—States (A 195–209)—Land area of States and territories (A 210–263)—Standard metropolitan statistical areas (A 264–287)—Households and families (A 288–358)—Inmates of institutions (A 359–371).

B. Vital Statistics and Health and Medical Care

VITAL STATISTICS---------- 44

Live births, deaths, marriages, and divorces (B 1–4)—Birth and reproduction rates (B 5–41)—Fertility trends (B 42–106)—Life expectancy (B 107–135)—Death rates (B 136–213)—Marriage and divorce rates (B 214–220).

HEALTH AND MEDICAL CARE---------- 65

Health care expenditures and price indexes (B 221–274)—Physicians, dentists, nurses, and medical, dental, and nursing schools (B 275–290)—Reportable disease rates (B 291–304)—Hospitals and beds (B 305–358)—Hospital admissions and use (B 359–388)—Hospital expense, insurance, finances, and personnel (B 389–422)—Mental hospitals (B 423–443)—Food consumption indexes (B 444–452)—Fluoridation of water systems (B 453–459).

C. Migration

INTERNAL MIGRATION---------- 87

Native population (C 1–24)—Intercensal migration (C 25–75)—Farm population (C 76–80)—Mobility status and type (C 81–88).

XNTBRNATIONAL MIGRATION AND NATURALIZATION---------- 97

Immigrants by country, occupation, and age (C 89–142)—Annual quota, and aliens admitted, deported, and naturalized (C 143–180)—Citizenship status (C 181–194)—Population, by country of origin (C 195–295)—Passenger arrivals and departures (C 296–331).

D. Labor

LABOR FORCE---------- 121

Components (D 1–10)—Status of population (D 11–25)—Gainful workers, by sex, by State (D 26–28)—Labor force, by age and sex (D 29–41)—Percent of noninstitutional population (D 42–48)—Female labor force (D 49–74)—Gainful workers, by age, sex, and occupation (D 75–84)—Unemployment (D 85–115)—Employment, by hours and major industry (D 116–151 and D 167–181)—Industrial distribution of workers (D 152–166)—Major occupation groups, by sex and detailed occupation (D 182–682).

EARNINGS, HOURS, AND WORKING CONDITIONS---------- 146

Output, man-hours, compensation, and labor cost indexes (D 683–704)—Average earnings of selected workers (D 705–793)—Earnings and hours in selected industries (D 794–892)—Wage supplements (D 893–912)—Earnings in selected occupations (D 913–926)—Labor union membership (D 927–969)—Work stoppages (D 970–1021)—Labor turnover (D 1022–1028)—Work-injury frequency rates (D 1029–1036).

Chapter *Page*

E. Prices and Price Indexes---------- 183

Price deflators for gross national product (E 1–22)—Wholesale price indexes (E 23–122)—Wholesale prices of selected commodities (E 123–134)—Consumer price indexes (E 135–182)—Cost-of-living indexes (E 183–186)—Retail prices of selected foods (E 187–202)—Retail price indexes of electricity, gas, and fuel (E 203–213)—Rent indexes (E 214).

F. National Income and Wealth

NATIONAL PRODUCT AND INCOME---------- 215

Gross and net national product and personal income (F 1–9)—Growth rates of gross national product and output per employee (F 10–16 and F 31)—Per capita income and product for selected items (F 17–30)—Gross and net national product in current and constant prices (F 32–143)—Relation of national product, income, and saving (F 144–162)—National income, by type (F 163–191)—National income, by sector and legal form of organization (F 192–209)—Distribution of aggregate payments (F 210–225)—National income, by industrial origin (F 226–237)—Value added by selected industries, and value of output of fixed capital (F 238–249)—National income and persons engaged in production (F 250–261)—Personal income and outlay (F 262–296)—Personal income, by States (F 297–348).

NATIONAL WEALTH AND SAVING---------- 246

National assets (F 349–376)—National balance sheet (F 377–421)—National wealth (F 422–469)—Private capital stocks (F 470–479)—Nonresidential business capital (F 480–527)—Residential capital (F 528–534)—Value of structures and equipment (F 535–539)—National saving (F 540–551)—Sources and uses of gross saving (F 552–565)—Individual and personal saving (F 566–667).

INPUT-OUTPUT STRUCTURE OF THE U.S. ECONOMY---------- 268

Value of input-output transactions, by industry (F 668–696)—Direct requirements per dollar of gross output (F 697–719)—Industrial composition per dollar of purchases, by final demand categories (F 720–723).

G. ***Consumer*** Income **and** Expenditures

FAMILY AND INDIVIDUAL INCOME---------- 284

Distribution of families and unrelated individuals, by income levels (G 1–30)—Distribution of income of families and unrelated individuals ranked by fifths according to income received (G 31–138)—Distribution of families ranked by fifths according to income received (G 139–178)—Number and median money income of families and unrelated individuals (G 179–256)—Distribution of individuals, families, and income, by income levels (G 257–305)—Number and size of families, number of unattached individuals, and family income before and after Federal income tax (G 306–318)—Family income received by each fifth and top 5 percent of families and individuals (G 319–336)—Shares of selected incomes received by top 1 percent and 5 percent of population (G 337–352)—Median money wage or salary income for specified recipients (G 353–415).

CONSUMER EXPENDITURE PATTERNS---------- 306

Personal consumption expenditures, by type of product (G 416–494)—Expenditures of city wage and clerical families of 2 or more persons (G 495–601)—Expenditures of all families of 2 or more persons in cities of 2,500 and over (G 602–696)—Expenditures of farm families (G 697–797)—

Chapter *Page*

Expenditures of families and single consumers combined (G 798–848)—Food marketings and consumption indexes. and nutrients available (G 849–856)—Nutritive value of city diets (G 857–865)—Food used at home, and per capita consumption (G 866–915).

H. Social Statistics

SOCIAL SECURITY AND WELFARE.. 332
Welfare expenditures under public programs (H 1–47)—Workers and payrolls, benefits and beneficiaries, under social insurance and related programs (H 48–171)—Old-age, survivors, disability, and health insurance, and insurance trust fund (H 172–259)—Civil service and railroad retirement (H 260–286)—Private pension and deferred profit-sharing plans (H 287–304)—Unemployment insurance and workmen's compensation (H 305–345)—Public and old-age assistance (H 346–381)—Child health and welfare services (H 382–391)—Vocational rehabilitation (H 392–397)—Private philanthropy (H 398–411).

EDUCATION 360
Kindergarten, elementary and secondary school enrollment, and children 'in special programs (H 412–485)—Finances of public elementary and secondary schools and private schools (H 486–519)—Public elementary and secondary school attendance and staff (H 520–530)—Pupil transportation (H 531–534)—Catholic elementary and secondary schools (H 535–544)—Public secondary school enrollment in specified subjects (H 545–571)—Federally aided vocational programs (H572–586)—School retention rates and high school graduates (H 587–601)—Years of school completed, by race, sex, and age (H 602–647)—Income of males 25 years and over, by years of school completed (H 648–663)—Illiteracy (H 664–688)—Institutions of higher education (H 689–765)—Doctorates (H 766–787).

RELIGIOUS AFFILIATION 389
Church denominations, members, and edifices (H 788–792)—Membership of religious bodies (H 798–805).

RECREATION 393
National parks, monuments, and allied areas (H 806–828)—Recreational use of national forest lands (H 829–835)—State and local park and recreation areas (H 836–861)—Recreational activities and expenditures (H 862–893)—Expenditures and travel to foreign countries, and passports (H 894–940)—Foreign visitors to the United States (H 941–951).

CRIME AND CORRECTION 407
Crimes and crime rates (H 952–970)—Homicides and suicides (H 971–986)—Police officers killed (H 987–998)—Persons arrested (H 999–1011)—Criminal justice system, expenditures (H 1012–1027)—Lawyers (H 1028–1062)—U.S. courts (H 1063–1124)—Training schools, detention homes, and Federal and State institutions (H 1125–1154)—Executions and lynchings (H 1155–1170).

J. **Land, Water,** and Climate

LAND AND WATER UTILIZATION 423
Territorial expansion and public domain (J 1–7)—Vacant lands and disposal of public lands (J 8–15)—Indian lands (J 16–19)—Public land sales and grants (J 20–25)—Revenues from public land (J 26–32)—Grazing on national forest and public-domain lands (J 33–40)—Oil and gas leases of public-domain lands (J 41–49)—Land utilization and ownership (J 50–80)—Land drainage and irrigation (J 81–91)—Water use and water wells (J 92–109).

CLIMATE 436
Temperature, precipitation, and description of year for climatological stations (J 110–247)—Temperature and precipitation for long-record city stations (J 248–267)—Tornadoes, floods, and tropical cyclones (J 268–278).

Chapter *Page*

K. **Agriculture**

FARMS 449
Population, farms, acreage, and value (K 1–16)—Population, farms, acreage, value, and products sold, by State (K 17–81)—Farm operator characteristics (K 82–108)—Farms, acreage, and value, by tenure of operator (K 109–153)—Mortgaged farms (K 154–161)—Farms and land, by size of farms (K 162–173)—Employment, wages, and man-hour indexes (K 174–183)—Machinery and equipment, fertilizer and lime (K 184–194)—Farmers' cooperatives (K 195–203).

AGRICULTURAL INCOME AND FINANCES 471
Balance sheet of the farming sector (K 204–219)—Gross farm product (K 220–250)—Exports and imports (K 251–255)—Income, expenses, marketings, and Government payments (K 256–329)—Commodity Credit Corporation (K 330–343)—Price indexes, parity ratios, and farm-to-retail price spreads (K 344–357)—Expenditures, farm value, and marketing bill for farm food products purchased by civilians (K 358–360)—Mortgage debt, *loans,* interest, and property taxes (K 361–375)—Non-real-estate loans and deposit indexes (K 376–383).

FARM PRODUCTIVITY 498
Supply and utilization of farm commodities (K 384–391)—Value of agricultural raw materials (K 392–406)—Productivity measures (K 407–495).

CROPS AND LIVESTOCK 503
Acreages of harvested crops, and cropland indexes (K 496–501)—Acreage, production, price, and stocks for specified crops (K 502–563)—Livestock, meat production, dairying, and poultry (K 564–623).

L. Forestry and Fisheries

FORESTS AND FOREST PRODUCTS 526
Forest land and timber (L 1–9)—National forest system areas, timber cut, receipts, and payments (L 10–31)—Tree distribution and management programs (L 32–43)—Fire control expenditures, forest Ares, and burned areas (L 44–55)—Raw materials and timber production, trade, and consumption (L 56–97)—Lumber production and consumption, and trade in lumber and logs (L 98–150)—Plywood, pulpwood, woodpulp, paper and board, turpentine, and rosin (L 151–191)—Newsprint, summary (L 192–197)—Forest product prices and price indexes (L 198–211)—Earnings in timber-based industries (L 212–223).

FISHERIES 549
Yield and value (L 224–235)—Quantity and value of landed catches (L 236–253)—Employment, fishing craft, and establishments (L 254–261)—Landed catches of principal species (L 262–293)—Consumption of products (L 294–304)—Disposition of catch, production and imports, and sponge sales (L 305–320)—Prices received by fishermen (L 321–337)—Production and value of processed fishery products (L 338–368)—Sealskins obtained and whale production (L 369–370).

M. Minerals 504
Summary of operations (M 1–12)—Value of products, imports, exports, and consumption (M 13–53)—Production indexes (M 54–75)—Energy production and consumption (M 76–92)—Bituminous coal (M 93–122)—Pennsylvania anthracite (M 123–137)—Petroleum, natural gas, and petroleum products (M 138–187)—Nonmetals (M 188–204)—Metals (M 205–270)—Injuries and fatalities (M 271–286)—Men working and man-hours worked (M 287–306).

Calvert L. Dedrick, *Chief, International Statistical Programs Office*
A. W. von Struve, *Acting Public Information Officer*

HERMAN P. MILLER, *Historical Statistics Project Director*

This volume stems from a joint interest by the Bureau of the Census and the Social Science-Research Council. It was planned, assembled, edited, and published by the Bureau, with the advice and assistance of the Committee on Historical Statistics appointed by the Council. Many other individuals and agencies cooperated and made significant contributions to this project. General acknowledgments for each chapter are presented on p. VII; other acknowledgments frequently appear in the text discussions of the various chapters.

The volume was prepared in the Bureau of the Census under the general direction of Edwin D. Goldfield, Chief, Statistical Reports Division. Herman P. Miller served as the Project Director and was primarily responsible for the planning, organizing, and supervising of all aspects of the compilation of the data. Dr. Miller also served as executive secretary of the Committee on Historical Statistics, handled liaison matters for the Committee, and participated in its selection of experts to serve as consultants. O. Halbert Goolsby acted as staff assistant.

Morris B. Ullman, who supervised the preparation of the previous volume, *Historical Statistics of the United States, 1789–1945*, was responsible for planning during the early stages of the project.

William Lerner, Assistant Chief, Statistical Reports Division, was primarily responsible for the planning and supervising of the publication aspects of the volume and for the review and editing of the text and tables. Dorothy M. Belzer was responsible for the tabular presentation of the data and preparation of the material for the printer. The Census Library Branch, Louise H. Clickner, Chief, also lent valuable assistance.

Social Science Research Council

The Committee on Historical Statistics appointed by the Social Science Research Council participated actively in the preparation of this volume, in the extension of the subjects to be added, and in planning the general procedures for securing expert assistance on each subject. As the project was developed the Committee, especially the Chairman, was primarily responsible for consideration of problems of data selection and format, for general appraisal of the quality of the series suggested for inclusion, and for the selection of consultant-specialists for the various subjects. The Committee as a whole, or through specially qualified members, reviewed the plans for inclusion of specific series and discussed areas of study which presented unusual problems.

Committee on Historical Statistics of the Social Science Research Council

BUREAU OF THE CENSUS

J. C. CAPT, *Director*
PHILIP M. HAUSER, *Deputy Director*
A. ROSS ECKLER, *Assistant Director*
HOWARD C. GRIEVES, *Assistant Director*
MORRIS H. HANSEN, *Statistical Assistant to the Director*
ROBERT Y. PHILLIPS, *Executive Assistant to the Director*
CALVERT L. DEDRICK, *Coordinator, International Statistics*
FRANK R. WILSON, *Information Assistant to the Director*

While this volume has been planned, assembled, and edited in the Bureau of the Census, with the advice and assistance of the Social Science Research Council, many other individuals and agencies contributed to its preparation, directly and indirectly. In some instances, individuals devoted themselves full-time for the period necessary to complete their phase of the project. In other instances, contributions were prepared by individuals while they maintained heavy responsibilities in their own offices. A number of private publishers, authors, and research organizations generously granted permission to use their materials. In some cases, they also made additional contributions in time and energy. General acknowledgments for each chapter are given on p. IV; other specific acknowledgments appear within the text in the various sections of the volume.

This volume was prepared in the office of Morris H. Hansen, Statistical Assistant to the Director of the Bureau of the Census, under the supervision of Morris B. Ullman, Chief, Statistical Reports Section, by Bruce L. Jenkinson, A. Benjamin Handler, and William Lerner. Mr. Jenkinson, Chief, Statistical Abstract Unit, was primarily responsible for the planning and preparation of the report; Mr. Handler, Executive Secretary of the Social Science Research Council Committee on the Source Book of Historical Statistics, was primarily responsible for procurement of data and relationships with the agencies and individuals who contributed to the publication; and Mr. Lerner, Statistician, Statistical Abstract Unit, was primarily responsible for the review and editing of the materials as to content, adequacy, and coverage.

Dorothy M. Belzer acted as staff assistant, particularly with respect to tabular presentation, and was responsible for preparation of the materials for the printer. Claire F. Cahill checked all citations by reference to the original published sources and offered many constructive suggestions as to the content of the book.

Social Science Research Council

The Social Science Research Council Committee on the Source Book of Historical Statistics, Advisory to the Bureau of the Census, played an important role in the preparation of this volume. The Chairman of the Committee and its members gave considerable time and thought to the review of plans, to advising on proper courses of action, and contributed in other ways. In particular, J. Frederic Dewhurst, Chairman, was in a large measure responsible for the initiation of the project. The completed volume owes much to his original outline of purpose, coverage, and arrangement. For a detailed statement of the origins of this historical volume, see introductory text.

Through a grant by the Committee on Research in Economic History (Arthur H. Cole, Chairman) of the Social Science Research Council, the full-time services of the Executive Secretary of the Advisory Committee were made available to the Bureau of the Census.

Acknowledgments for Chapter Contributions *

Chapter A. Population

Historical Statistics . . . Colonial Times to 1970

Consultant — Philip M. Hauser, University of Chicago
Major contributor — Campbell J. Gibson, Population Division, Bureau of the Census

Historical Statistics . . . Colonial Times to 1957

Principal consultant — Population Division, Bureau of the Census
Review consultant — Irene B. Taeuber, Princeton University
Other contributor — Donald S. Akers, Bureau of the Census

Historical Statistics . . . 1789–1945

Material on population prepared by Bureau of the Census staff.

Chapter B. Vital Statistics and Health and Medical Care

Historical Statistics. . . Colonial Times to 1970

VITAL STATISTICS

Consultant — Irene B. Taeuber, Princeton University
Major contributors — Wilson H. Grabill, Bureau of the Census; Michael J. Zugzda, National Center for Health Statistics

HEALTH AND MEDICAL CARE

Consultant — Herbert E. Klarman, New York University

Historical Statistics . . . Colonial Times to 1957

VITAL STATISTICS

Principal consultant — Robert D. Grove, National Office of Vital Statistics
Review consultant — Irene B. Taeuber, Princeton University
Other contributors — Joseph Schachter and Mildred L. McKinnon, National Office of Vital Statistics; Wilson H. Grabill, Bureau of the Census

HEALTH AND MEDICAL CARE

Principal consultant — Maryland Y. Pennell, Public Health Service
Review consultant — Antonio Ciocco, University of Pittsburgh

Historical Statistics . . . 1789–1945

Basic text and series on vital statistics supplied by National Office of Vital Statistics, Public Health Service, Federal Security Agency.
Basic text and series on health supplied by Division of Public Health Methods, Office of the Surgeon General, Public Health Service, Federal Security Agency.
Basic text and series on nutrition supplied by Bureau of Human Nutrition and Home Economics and Bureau of Agricultural Economics, Department of Agriculture.

Chapter C. Migration

Historical Statistics . . . Colonial Times to 1970

Consultant — Henry S. Shryock, Jr., Georgetown University

Historical Statistics . . . Colonial Times to 1957

INTERNAL MIGRATION

Principal consultants — Everett S. Lee and Dorothy S. Thomas, University of Pennsylvania
Review consultant — Irene B. Taeuber, Princeton University
Other contributor — Anne S. Lee, University of Pennsylvania

INTERNATIONAL MIGRATION AND NATURALIZATION

Principal consultant — Edward P. Hutchinson, University of Pennsylvania
Review consultant — Niles Carpenter, The University of Buffalo
Other contributors — Helen F. Eckerson and Gertrude D. Krichefsky, Immigration and Naturalization Service

Historical Statistics . . . 1789–1945

Material on internal migration, citizenship, and country of birth prepared by Bureau of the Census staff.
Basic text and series for immigration, emigration, and naturalization supplied by Mrs. Helen F. Eckerson, Supervisor of the Statistics Section, Division of Research and Education, Immigration and Naturalization Service, Department of Justice.

Chapter D. Labor

Historical Statistics . . . Colonial Times to 1970

Consultant — Stanley Lebergott, Wesleyan University

Historical Statistics . . . Colonial Times to 1957

LABOR FORCE

Principal consultant — Seymour L. Wolfbein, Bureau of Labor Statistics
Review consultant — Clarence D. Long, The Johns Hopkins University

***HOURS*, WAGES, AND WORKING CONDITIONS**

Principal consultants — H. Gregg Lewis and Albert Rees, The University of Chicago
Review consultant — Harry M. Douty, Bureau of Labor Statistics

Historical Statistics . . . 1789–1945

Material on labor force prepared by Bureau of the Census staff.
Basic text and series on wages and working conditions largely supplied by Bureau of Labor Statistics, Department of Labor, Margaret H. Schoenfeld, Economic Editor, coordinating,,

Chapter E. Prices and Price Indexes

Historical Statistics . . . Colonial Times to 1970

Consultant — Irving B. Kravis, University of Pennsylvania

Historical Statistics . . . Colonial Times to 1957

Principal consultant — Ethel D. Hoover, Bureau of Labor Statistics
Review consultants — Arthur H. Cole, Harvard University; Geoffrey H. Moore, National Bureau of Economic Research, Inc.

Historical Statistics . . . 1789–1945

Basic text and series supplied by Prices and Cost of Living Branch, Bureau of Labor Statistics, Department of Labor.

* See also Appendix, p. A–1.

Chapter **F.** National Income **and** Wealth

Historical Statistics . . . Colonial Times to 1970

NATIONAL PRODUCT AND INCOME; NATIONAL WEALTH AND SAVING

Consultant — Edward F. Denison, The Brookings Institution

Major contributors — Nora E. Dollymore, Robert E. Graham, and Allan H. Young, Bureau of Economic Analysis; Raymond W. Goldsmith, Yale University; Stephen P. Taylor, Board of Governors of the Federal Reserve System

INPUT–OUTPUT STRUCTURE OF THE **U.S.** ECONOMY

Consultant — Albert J. Walderhaug, Bureau of Economic Analysis

Historical Statistics . . . Colonial Times to ***1957***

Principal consultant — Richard A. Easterlin, University of Pennsylvania

Review consultant — Simon Kuznets, The Johns Hopkins University

Other contributor — Raymond W. Goldsmith, National Bureau of Economic Research, Inc.

Historical Statistics . . . 1789–1945

Chapter prepared by Harlow D. Osborne, Economic Analyst, National Income Division, Bureau of Foreign and Domestic Commerce, Department of Commerce.

Chapter ***G.*** Consumer Income and Expenditure

Historical Statistics . . . Colonial Times to 1970

Consultant — Herman P. Miller, Temple University

Major contributors — I-Ienry Aaron, The Brookings Institution; Roger A. Herriot, Bureau of the Census

Historical Statistics. . . Colonial Times to 1957

FAMILY AND INDIVIDUAL INCOME

Principal cpnsultant — Selma F. Goldsmith, Office of Business Economics

Review consultant — Dorothy S. Rrady, University of Pennsylvania

CONSUMER EXPENDITURE PATTERNS

Principal consultant — Faith M. Williams, Bureau of Labor Statistics

Review consultant — Rose D. Friedman, Chicago, Illinois

Other contributors — Joseph A. Clorety, Anna-Stina L. Ericson, Helen H. Lamale, Bureau of Labor Statistics; Marguerite C. Burk, Agricultural Marketing Service, and Jean L. Pennock, Agricultural Research Service

Chapter **H.** Social Statistics

Historical Statistics . . . Colonial Times to 1970

SOCIAL SECURITY AND WELFARE

Consultant — Ida C. Merriam, Social Security Administration

Major contributor — Alfred M. Skolnik, Social Security Administration

EDUCATION

Consultant — Abbott L. Ferriss, Emory University

Major contributors — J. Fred Beamer and C. George Lind, Office of Education

RELIGIOUS AFFILIATION

Consultant — Constant H. Jacquet, Jr., National Council of the Churches of Christ

RECREATION

Consultant — Marion Clawson, Resources for the Future, Inc.

CRIME AND CORRECTION

Consultants — Thorsten Sellin and Marvin E. Wolfgang, University of Pennsylvania

Major contributors — James A. McCafferty, Administrative Office of the United States Courts; Paul White, Law Enforcement Assistance Administration

Historical Statistics. . . Colonial Times to 1957

SOCIAL SECURITY AND WELFARE

Principal consultant — Ida C. Merriam, Social Security Administration

Review consultant — Eveline M. Burns, Columbia University

Other contributor — George Rohrlich, Bureau of Employment Security

EDUCATION

Principal consultant — Emery M. Foster, Office of Education

Review consultants — Helen M. Walker, Columbia University; John Walton, The Johns Hopkins University

Other contributors — Henry G. Badger, W. Vance Grant, and Rose Marie Smith, Office of Education; Charles B. Nam, Bureau of the Census

RELIGIOUS AFFILIATION

Principal consultant — Benson Y. Landis, National Council of the Churches of Christ in tho United States of America

Review consultant — Edmund deS. Brunner, Columbia University

RECREATION

Principal consultant — Marion Clawson, Resources for the Future, Inc.

Review consultant — Thomas C. Fichandler, The Twentieth Century Fund

Other contributor — George D. Butler, National Recreation Association

CRIME AND CORRECTION

Principal consultant — Ronald H. Beattie, California Department of Justice, State of California

Review consultant — Thorsten Sellin, University of Pennsylvania

Other contributors — Benjamin Frank, Henry C. Lanpher, James A. McCafferty, Bureau of Prisons

Chapter J. **Land,** Water, and Climate

Historical Statistics . . . Colonial ***Times*** *to 1970*

LAND AND WATER UTILIZATION

Consultant — Marion Clawson, Resources for the Future, Inc.

CLIMATE

Consultant — George S. Benton, The Johns Hopkins University

Major contributor — Harry Torbitt, National Climatic Center

Historical Statistics . . . Colonial Times to 1967

LAND AND WATER UTILIZATION

Principal consultants — Ernst H. Wiecking and Hugh H. Wooten, Agricultural Research Service; Walter L. Picton, Business and Defense Services Administration

Review consultant — Marion Clawson, Resources for the Future, Inc.

CLIMATB

Principal consultants — Helmut E. Landsberg and J. Murray Mitchell, Jr., Weather Bureau

Review consultant — George S. Benton, The Johns Hopkins University

Other contributor — Milton L. Blanc, Weather Bureau

Historical Statistics . . . 1789–1945

Basic text and series on public lands supplied largely by Branch of Research, Bureau of Land Management, Department of the Interior.

Basic text and series on land utilization supplied by Bureau of Agricultural Economics, Department of Agriculture.

Chapter **K.** Agriculture

Historical Statistics . . . Colonial Times to 1970

Consultant—Earl E. Houseman, Department of Agriculture
Major contributors—J. Richard Grant, Department of Agriculture; Arnold **L.** Bollenbacher and Orvin L. Wilhite, Bureau **of** the Census

Historical Statistics . . . Colonial Times lo 1957

Principal consultant—Department of Agriculture (Earl E. Houseman, Coordinator)
Review consultant—Theodore W. Schultz, The University of Chicago

Historical Statistics . . . 1789-19.45

Basic text and series supplied by Bureau of Agricultural Economics and Farm Credit Administration, Department of Agriculture, Robert M. Walsh, Special Assistant to the Chief of the Bureau of Agricultural Economics, coordinating.

Chapter **L.** Forestry **and** Fisheries

Historical Statistics . . . Colonial Times to 1970

FORESTS **AND** FOREST **PRODUCTS**

Consultant—Robert S. Manthy, Michigan State University
Major contributor—Dwight Hair, Forest Service

FISHERIES

Consultant—Howard Horton, Oregon State University
Major contributor—William Robinson, National Marine Fisheries Service

Historical Statistics . . . Colonial Times to 1957

FORESTS **AND FOREST PRODUCTS**

Principal consultant—Dwight Hair, Forest Service
Review consultant—William A. Duerr, Syracuse University

FISHERIES

Principal consultant—Harvey L. Moore, Fish and Wildlife Service
Review consultant—F. Heward Bell, International Pacific Halibut Commission
Other contributor—Edward **A.** Power, Fish and Wildlife Service

Historical Statistics . . . 1789-1945

Series on forestry supplied by Division of Forest Economics, Forest Service, Department of Agriculture.
Series of fisheries supplied by Statistical Section, Division of Commercial Fisheries, Fish and Wildlife Service, Department of the Interior.

Chapter **M.** Minerals

Historical Statistics . . . Colonial Times to 1970

Consultant—Vivian E. Spencer, University of Connecticut

Historical Statistics, . . Colonial Times to 1957

Principal consultants—Sam **H.** Schurr and Elizabeth K. Vogely, Resources for the Future, Inc.
Review consultant—Vivian E. Spencer, Bureau of the Census
Other contributor—Robert E. Herman, Bureau of Mines

Historical Statistics . . . 1789-1945

Basic text and series on minerals supplied *by* Economics and Statistics Branch, Bureau of Mines, Department of the Interior, Hubert D. Keiser and Allan F. Matthews, former and present editors **of** the *Minerals Yearbook,* coordinating.

Introduction

This volume is the third in the *Historical Statistics* series issued by the Bureau of the Census as a supplement to the annual *Statistical Abstract of the United States.*

Statistics are a valuable adjunct to historical analysis, They often clarify and enrich qualitative history and on occasion become important parts of a historical record on their own. However, users of historical data are faced with the paradox of over-abundance and scarcity. A burdensome multiplicity of sources has frequently to be consulted in order to reconstruct one quantitative aspect of a particular subject. Just as often, users are confronted by a discouraging barrenness of data, discoverable only after much costly work and delay.

The objective of the *Historical Statistics* volumes is to provide a convenient reference source which has two functions, *collecting* and *referring.* The *collecting* function consists of assembling, selecting, and arranging data from hundreds of sources and making them available within a single source. The *referring* function consists of text annotations to the data which act as a guide to sources of greater detail. The annotations also define terms used in the tables and include essential qualifying statements.

The first volume in this series, *Historical Statistics of the United States, 1789–1945,* was published in 1949. It provided a wide range of series quantifying various aspects of the development of the Nation. An interim *Continuation to 1951* was issued in 1954 to provide data for 1946 to 1962 for the still-active series shown in the first volume. Limited resources confined the scope of the first volume to data most readily available, usually from governmental agency sources. Nevertheless, some **3,000** statistical time series were presented.

Historical Statistics of the United States, Colonial Times to 1957, issued in 1960, represented a substantial expansion of the data shown in the original volume. It presented more than 8,000 time series, mostly annual, on a greater variety of subjects and for longer time periods. The statistics were also more fully annotated and more precise references to original sources were provided. For a greater number of series, in addition, there were more detailed descriptions of the development and reliability of the data. A *Continuation to 1962 and Revisions* was issued in 1965, presenting revisions of data in the basic volume and extensions to 1962 of the more than 6,000 series still current at that time.

Each of the first two volumes was prepared with the cooperation of the Social Science Research Council, the guidance of a distinguished Advisory Committee, and the assistance of numerous scholars, research analysts, and particular subject specialists. A description tracing the development of the first two editions appears below under "Origin of Historical Statistics of the United States."

During the latter 1960's, the supply of copies of *Historical Statistics ... to 1967* available for sale from the U.S. Superintendent of Documents was exhausted. The edition had already been through a cycle of five printings and a question was raised concerning the advisability of further printings in the light of a possible new edition. The question was timely. Experience with the first two editions and their *Continuation* supplements had shown that a new edition was desirable at 10 to 12 year intervals. The *Continuation* supplements were at best handy stopgaps for researchers, a serviceable minimum seriously lacking in documentation. As each year lengthened the interval between editions, the "convenience" value of both the *Continuation to 1961* and its parent *Historical Statistics... to* 1967 diminished. More and more time series were revised in part or entirely replaced. Further, the task for the user of updating the still active, unrevised, series became more burdensome despite the special efforts of the annual *Statistical Abstract* to maintain a direct linkage to as many historical series as possible in its current tables. As a result, a decision was made in 1969 to begin preparation of a new edition.

The plans for the new edition immediately encountered the problem of funding and resources. It was clearly impractical at that time, given the available resources, to consider undertaking a full-fledged new edition of *Historical Statistics.* The determination to make a start, however, was very strong and more modest objectives were adopted. In effect, the early plans for the present edition proposed that it comprise little more than: (1) An extension to 1970 of those series for which current data were available; (2) revisions of data which had occurred since issuance of the *Continuation to 1962;* and (3) a reprinting of those series in *Historical Statistics. ..to 1957* which had not been affected by either updating or revisions. No time span was specifically set down to complete the work because there was a clear understanding that it was a part-time staff project.

Two other aspects of this plan differed considerably from the procedures followed for the last edition. For that edition, a large number of consultants were enlisted for their expertise in assembling and developing new time series, reviewing and adjusting old time series, and providing explanatory and bibliographic notes for both. Although most of these consultants, especially those in Federal agencies, contributed their own and their agencies services without compensation, many were compensated from funds provided by the Ford Foundation (by arrangement through the Social Science Research Council). For the new edition, given the limited resources, consultants' contributions were recruited on a public service basis entirely. Partly for the same reason, it was decided not to revive the collaboration of the Census Bureau with the Social Science Research Council which had proved so highly effective for the first two *Historical Statistics* editions. Even more convincing for the Bureau decision to undertake the project alone was the solidity of the base which those editions now provided for the next edition. Seeking such collaboration again seemed unwarranted in the light of the modest objectives outlined above,

As the work slowly progressed and as the many consultants and contributors gave generously of their knowledge and talent, it became clear that our objectives were too restrictive; that our contemplated mere updating would, if adhered to, have to ignore a large accumulation of new time series which were either ineligible for the last edition (at that time they covered a period of less than **20** years) or had not been discovered or properly developed prior to that edition. The gradual accretion of new material plus the additions to old material substantially changed the planned scope of the present edition. What follows are some measures of the changes in content introduced in the present edition.

All of the broad subject fields shown as separate chapters in the last edition are included in this edition and follow the same sequence. Within some of the chapters, however, chapter segments have been regrouped into new subchapters (as in chapters K and X) and in others, the sequence of the subchapters has been changed (as in chapters H, Q, and U) to achieve minor improvements in the juxtaposition of subjects.

In two chapters, two entirely new subchapters have been added: "Input-Output Structure of the US. Economy" to chapter F and "Flow of Funds" to chapter X.

The present edition presents more than 12,500 time series, a 50-percent increase over the last edition. Every chapter has undergone some expansion with respect to new time series. Chapter F, national income and wealth, and chapter H, social statistics, doubled in num-

ber of series; the former from 345 to 723 and the latter from 543 to 1,170. The increase in chapter F was largely due to newly-added data for economic growth rates, greater detail than was previously shown for national and personal income, and data showing valuation of capital stocks. Unsurprisingly, the largest increase in series occurred in chapter H where the data for social insurance and welfare, education, and crime and correction reflect the great public attention given to these subjects in recent decades. Almost equally large increases took place for chapter K, agriculture, and chapter X, financial markets and institutions (formerly banking and finance); chapter K from 328 series to 623; chapter X from 480 to 962. Partly to accommodate the increase in series, chapter K has been subdivided into 4 parts. Most of the new series in chapter K relate to farm population and farm-operator characteristics, farm marketings, government payments and price supports, and a number of new measures of farm productivity. For chapter X, the bulk of the increase in series is in the new flow-of-funds subchapter.

Several chapters now include for the first time a number of data series below the national level. In *all,* there are 13 new tables (comprising 484 series) in this category, 9 of which present data for the individual States and 4 for either regions (e.g. the South or the West) or the smaller geographic divisions (e.g. New England, South Atlantic). Perhaps of special interest among these tables are the series on population characteristics and land area for each State (A 195–263), those on selected items for farms and farm population by State (K 17–81), those on voter participation in presidential elections by State (Y 27–78), and those on population censuses taken in the colonies and States during the colonial and pre-Federal period (Z 24–132).

In addition, each of 4 chapters (D, G, Q, and Z) includes at least 200 or more new series and each of 10 chapters (A, B, L, N, P, S, T, U, V, and *Y*) includes 100 or more. A summary of selected new series included in each chapter is shown on p. XV.

One other important change is the reinstatement of a time period index (see p. A–4) which first appeared in *Historical Statistics. . .,* *1789* to *1945.* The index enables users to identify quickly which time series (or statistics for particular subjects) begin in the specified 10- or 20-year time segment (e.g. 1800–1819, 1820–1839).

As a result of the complete review and updating of the contents of the last edition of *Historical Statistics,* many changes, apart from the entirely new series, have occurred in both the tables, the descriptive text, and the bibliographic notes. Most of the changes are due to revisions and corrections made during the interval between the last and present editions by the sources of the data affected. Where users of both editions become aware of discrepancies in what purport to be identical sets of data, it is safe to assume that the figures, descriptive text, and notes in the present edition supersede those in the last edition.

With rare exception, all of the series shown in the last edition are also included here. 76 series were omitted. They were primarily discontinued series replaced on recommendations of consultants by other series of a similar kind or were considered of marginal importance or relatively weak in other respects. In one or two instances, space was also a factor.

Origin of *Historical Statistics of the United States*

The first edition, *Historical Statistics of the United States, 1789–1945,* was formally initiated by a recommendation in 1945 by the Social Science Research Council that the Secretary of Commerce consider compilation and publication by the Bureau of the Census of a source book of economic statistics.

Earlier the same year, J. Frederic Dewhurst urged the development of an historical source book in a proposal to the American Statistical Association and the American Economic Association. A joint committee was named by these associations, joined by the Economic History Association, to explore the practical problems of preparing such a volume. Dr. Dewhurst's proposal coincided closely with Bureau of the Census plans to prepare an historical supplement to the *Statistical Abstract of the United Slates.* The formal decision in 1945 by the Bureau of the Census to compile and publish such a volume led to the reconstitution of the joint committee, which then became the Social Science Research Council Committee on the Source Book of Historical Statistics, Advisory to the Bureau of the Census.

After the first edition was issued in June 1949, the Economic History Association, in response to a request from the Bureau of the Census, appointed an advisory committee in September 1950 to evaluate the volume and to make specific recommendations affecting the question of its revision. This committee, formally designated as the Committee of the Economic History Association on the Revision of *Historical Statistics of the United States, 1789–1945,* was under the chairmanship of G. Heberton Evans, Jr., The Johns Hopkins University, and included the following as members: Arthur H. Cole, Harvard University; Shepard Clough, Columbia University; T. C. Cochran, University of Pennsylvania, and Solomon Fabricant, National Bureau of Economic Research, Inc. In April 1952 the committee submitted a report to the Bureau of the Census entitled "On the Revision of *Historical Statistics of the United States, 1789–1945."* The conclusions and comments presented in this report were subsequently influential in getting underway the project for a revised volume.

For the second edition, *Historical Statistics of the United States, Colonial Times to 1957,* the Bureau designated a project director who also acted as secretary of the Committee on Historical Statistics appointed by the Social Science Research Council to serve as an advisory group similar to the committee which participated in the preparation of the first edition. The Census Bureau again assumed the responsibility for publishing the volume as a part of its *Statistical Abstract* program. The Social Science Research Council, in turn, obtained a grant from the Ford Foundation which provided funds for the procurement of services of experts in each field. More than 125 such specialists were engaged to serve as consultants. The Council also made arrangements with some of the consultants for the preparation of bibliographic essays on statistics in selected fields, five of which were subsequently published in the *Journal of the American Slatistical Association.*

The Problem of Historical Statistics

The scattered sources of historical statistics of the United States include the annual reports of the executive heads of the agencies of the Federal Government, reports of special Federal commissions, the U.S. census volumes, printed debates of the Congress, published reports of committees of the Congress and transcripts of hearings on important legislative measures, published reports and docuinents of the State governments, statistical publications of private research organizations and of the universities and colleges of the Nation, together with the great mass of statistical volumes printed by other private organizations and individuals.

It has been noted that on occasion compilers, desiring to save the time and effort required to obtain data directly from the original sources, make use of successive issues of the annual *Statistical Abstract of the United States* to construct long-term time series. The results of such a procedure are not always sound, since the space available in the *Statistical Abstract* for describing major revisions in time series may not permit adequate clarification. Of the many revised figures appearing in each issue, most revisions apply to the immediate preceding years, but revisions of much earlier years are not uncommon, Moreover, the revisions shown have followed no systematic: pattern and may be scattered irregularly over many issues.

Impediments to the use of historical statistics, then, include the initial difficulty of determining whether the data in fact exist, of identifying the document in which the data may be found, of constructing time series where the data may not be arranged in suitable form, and of identifying and interpreting changes in concept and

coverage. Definitions employed in published historical tables, moreover, may have to be sought in separate publications if, indeed, they have been published at all.

Technical Notes and Explanations

Arrangement of *the* data. Data are arranged for broad subjects in lettered chapters and for more specific and detailed subjects in numbered series within each chapter. To facilitate reference, subject groups are organized in summary form under chapter and subchapter titles in the table of contents (p. IV). In addition, there is a detailed alphabetical subject index (p. A–10). The data are presented in conventional tabular form, each table comprising a group of subject-related series. Each series or tabular column is assigned a unique letter and number. The letter prefix identifies the chapter and the number represents the order of the series in the chapter. Thus the 44th series in the chapter on agriculture is designated K 44 to distinguish it from the 44th series in the chapter on transportation, Q 44. Because of possible confusion with numerals, the capital letters I and O have been omitted in identifying chapters. Source citations and descriptive text material (see below) are linked to the data series by use of the assigned series numbers.

All series begin with the most recent year for which data have been obtained and run backward in time. This arrangement was selected because it lent itself to more compact, less space-consuming presentation than the alternative of beginning with the earliest year. Insofar as possible, there are uniformly placed spaces above every year ending in 0 or 5. No data are shown for years subsequent to 1970. Figures for later years for most of the current series are presented in the *Statistical Abstract of the United States* beginning with the 1973 edition.

Basic guidelines. The guidelines adopted for this edition to aid Census Bureau staff members, subject matter consultants, and other participants with respect to selection and presentation of the data are quite similar to those of the last edition. As was the case then, however, the guidelines were not followed with complete rigidity. At times, the scope, variety, and complexity of the data involved made it necessary to modify the rules for the sake of clarity or internal consistency. The guidelines applied and the elements subject to application are discussed below.

Area coverage. Except as otherwise specified, data genorally represent conterminous United States or the 48 States (including the District of Columbia) prior to the admission of Alaska and Hawaii to statehood and the 50 States thereafter. Asterisks on individual tables or series indicate the first year for which the figures include Alaska and Hawaii to the extent that their inclusion could be ascertained. For some series, especially in chapter K, the notes specifying inclusion or exclusion of Alaska and Hawaii appear in the text. In some instances, the sources used for data failed to specify the area covered. Where practicable, the data were examined and the appropriate qualifications were added.

Because of limitations of space, data are not generally shown for regions, States, or localities. Some exceptions were permitted, however, as noted above with respect to data for regions and States. Other exceptions were of a more specialized nature as in the following instances: Where regional statistics are helpful for correct interpretation of data, such as presentation of merchant marine statistics separately for each coast and for inland waters; where data in the subject field cannot (by definition) be summarized effectively for the United States, such as internal migration data; where summary data for a given subarea or market are indicative of general trend or level, such as prices on the New York Stock Exchange or in specified cities; where data for a given area effectively represent the national picture because of concentration of production, etc., as Pennsylvania anthracite; where data are available for only a given area as in the case of many series concerned with early American history and limited to the Atlantic seaboard.

Time coverage. In general, only annual or census-period data which cover at least **20** years are presented. **A** major exception was made for series covering the colonial or pre-Federal period. Other exceptions were permitted where newly developed series of recent origin were the only data available to represent an important subject field or where a short series was an important extension of other longer series.

The general requirements as to time coverage were specifically designed to permit inclusion of "lapsed" series, particularly those falling within the nineteenth century or extending into the early twentieth century. The lapsed series, which begin and terminate in the past, represent major fields of interest during various phases of American historical development; frequently they must be sought in out-of-print documents which are available in few libraries.

The identification of time-periods was complicated by failure of some sources to state whether the data were prepared on a calendar-year or on a fiscal-year basis; by shifts in time coverage from calendar to fiscal year during the period of the series, and, in some instances, by the lack of identification of the beginning or ending date of the fiscal year. **In** all such cases, particularly where time shifts seemed likely to have occurred, an effort was made to identify the correct basis.

Frequency of data. Annual data are given preference but certain series are presented only for years in which a national census was conducted, and, in some instances (for example, telephone and telegraph rates), only for the scattered dates for which the data are available. Where both annual figures and decennial or quinquennial benchmark or census data exist, both series are frequently shown.

Series linkage. No formal attempt was made to extend a single series back through time by linking it to another series which terminated at or near the date on which the first began. In a number of instances, however, such series are presented in adjoining columns, with an overlap for a period of years, when available.

Selection of data. The criteria of selection varied broadly, depending on a number of factors applicable to the subject matter involved. Generally, summary measures or one-dimensional aggregates at gross levels and immediately below were given highest priority for inclusion. Below such levels, selection was governed by the interplay of: The amount of space already devoted to a particular subject; the attempt to achieve a relatively balanced presentation among subject fields; the "uniqueness" (in the sense that other data did or did not fairly cover a particular subject) of the data; the quantity of data available; the quality of the data available; and the extent to which data might be related to and enhance the value of other data.

Among less discretionary factors, both area detail (see above under area coverage) and subject detail, such as cross-classifications or data for specific commodities, were held to a minimum because of space limitations. Inevitably, there were exceptions where synthesis or summarization did serious damage to the value of a series or where it was clearly more meaningful to show series for specific commodities than a group aggregate.

Presentation **of absolute rather** than derived **data.** Primary emphasis was placed on the presentation of absolute figures rather than on derived data since the absolute figures offer somewhat greater flexibility to the user, The major exception was the presentation of index numbers. In general, percentage distributions of absolute data already shown are not presented, Other percentage data, and averages, medians, ratios, and rates were used only where they resulted in a significant economy in space or where they significantly facilitated interpretation. No attempt **was** made to convert various series of index numbers to a base year or period other than that shown in the source. Large numbers (8 digits or more, for example) shown in the source documents have been rounded to thousands, millions, or billions for ease of use and reference only as staff resources allowed.

Omissions **of** data, "blank" cells. The significance of dasher in tabular cells varies from series to series. In general, the presence of cell "leaders" or "dashes" indicates merely that no information was provided. Dash entries may mean that no information exists for the given year; the entry, if shown, would be zero; the information

was not available; or the information is believed to exist in published form but it was not practicable to do the research necessary to locate the appropriate source. The user will have to judge from the context which meaning is appropriate in each particular instance.

The practices of the various sources of information differ as to the meaning of dashes in cells, the extent to which they label data as "not available," the meaning of the term "not available," the use of the zero entry, etc. In general, the policy adopted in preparing this volume was to retain "not available" notations where they appeared for intermediate years in the series; to change them to dashes where they appeared at the beginning or end of the series. Where cells were left blank in the sources, they were filled with dashes unless there was evidence that "not available" was a more appropriate entry.

Since series of varying length taken from different sources are frequently found in adjoining columns in a table, the stub listings for years necessarily encompass the earliest and latest date for which any of the series in the table are shown. In itself, this tends to create many additional blank cells since missing entries have been replaced by dashes in order to make it easier for the user's eye to trace the entries for a given year across the entire table.

Source citations and text. For every series shown, the text notes present the source or sources of the data. In most cases, precise publication dates and page or table numbers are given. However, where numerous issues of a certain publication were used, the source citations are usually limited to "annual issues," "various monthly issues," or similar notations. The term "unpublished data" means that the data were not in published form at the time they were obtained for use in this edition. In many cases, such data were scheduled for inclusion in forthcoming publications.

Where possible the descriptive text includes definitions of concepts and terms used, and sufficient methodological and historical information to permit intelligent use of the data. For many series the text also includes reference to where more detail can be found. Unusual values in a series are explained and major changes which affect comparability are noted. Methods used for adjusted or derived figures are described, often with reference to a more complete description.

Copyright material. Copyright restrictions, where applicable, are noted in source citations. Permission to quote or reprint copyright material should be obtained directly from the copyright owner.

Statistical Reliability and Responsibility

The contents of this volume were obtained from a large number of sources. All data from either censuses and surveys or based on estimates or administrative records are subject to error arising from a number of sources: Sampling variability (for statistics based on samples), reporting errors in the data for individual units, incomplete coverage, nonresponse, imputation, and processing error. The Bureau of the Census cannot accept responsibility for the accuracy or the limitations of data presented here, other than for those which it collects. Every attempt has been made, within the limits of time and available personnel, to verify and correctly identify the material. Final responsibility for selection of the material, and for its accurate and proper presentation, rests with the Bureau of the Census, even though carried out with the cooperation of many individuals and agencies who devoted much time and energy in providing data and descriptions of series for this publication.

The information presented in this volume supersedes all similar information presented in *Historical Statistics of the United Slates, Colonial Times to 1957,* and in *Historical Statistics of the United States, Colonial Times to 1957: Continuation to 1962 and Revisions.*

FOR ADDITIONAL INFORMATION **ON** DATA PRESENTED

please consult the source publications available in local libraries or write to the agency indicated in the source note in the descriptive text for the given statistical series. Write to the Bureau of the Census only if it is indicated as the source.

Summary of Selected New Series in This Edition

Chapter and title	Number of new series	Summary of selected new series
A. Population	198	Urban population characteristics (A 82–90); foreign born, by sex and race (A 105–118); population characteristics and land area, by States A 195–263); households, by number of persons (A 335–349); inmates of institutions (A 359–371)
B. Vital Statistics and Health and Medical Care	180	Fertility and birth rates, by age of mother (B 11–19); illegitimate births and rates (B 28–35); health expenditures (B 221–261); hospital use rates, expenses, personnel, and insurance coverage (B 381–422)
C. Migration	36	Aliens naturalized (C 162–167); passenger arrivals and departures (C 296–331)
D. Labor	227	Working women (D 49–74); unemployment rates (D 87–115); employee output (D 683–704); employee earnings D 705–786); union membership an6 work stoppages (D 927–939, D 986–1021)
E. Prices	22	**GNP** implicit price deflators (E 1–22)
F. National Income and Wealth	362	**GNP** growth rates and per capita (F 10–31); *GNP* summary and by type of industry (F 32–46), F 130–162); national and personal income (F 163–209, F 250–348); national tangible assets (F 349–376); value and age of capital stocks (F 470–534)
G. Consumer Income and Expenditures	292	Distribution of families and persons, by money income levels (G 1–268); nutritive value of city diets (G 857–865); food used at home (G 866–880)
H. Social Statistics	675	Employee benefit plans (H 70–114); OASDHI (social security) coverage, benefits, and trust fund (H 186–259); Civil Service retirement (H 260–270); private philanthropy (H 398–411); schools and school enrollment (H 418–432, H 442–522); school retention rates (H 587–597); income, by years of school completed (H 648–663); illiteracy (H 669–688); doctorates, by field (H 766–787); foreign travel, passports issued, and foreign visitors to U.S. (H 894–951); crimes and crime rates (H 952–961); homicides and suicides (H 971–986); criminal justice expenditures (H 1012–1027); lawyers (H 1028–1062); courts (H 1063–1124)
J. Land, Water, and Climate	15	Indian lands (J 16–19); tornadoes, floods, and cyclones (J 268–278)
K. Agriculture	315	Farm population, land in farms, farm property, farm products sold (K 1–81); farm operator characteristics (K 82–108); balance sheet of farming and value of gross farm product (K 204–239); farm income and farm marketings (K 256–343); farm productivity (K 407–495)
L. Forestry and Fisheries	153	Forest products production, imports, exports, and consumption L 56–71, L 87–97, L 138–165, L 178–198); fishery imports and exports (L 224–235); value of landed fish catches (L 244–253); prices received by fishermen (L 321–337)
M. Minerals	26	Employment and man-hours in mineral industries (M 287–306)
N. Construction and Housing	120	Wholesale price indexes for construction materials (N 140–155); new publicly-owned housing starts (N 171–179); value and mean age of stocks of residential structures (N 200–231); housing vacancy rates (N 246–258)
P. Manufactures	132	General statistics (P 58–67); horsepower of power equipment (P 68–73); shipments, inventories, and orders (P 74–92); corporation sales, profits, and equity (P 93–106); shares of largest companies (P 177–204); consumption of selected commodities (P 216–230)
Q. Transportation	240	Intercity passenger traffic (Q 1–11); revenues and employment, by type of transport (Q 23–46); intercity motor carriers (Q 69–81); long-term public highway debt (Q 136–147); motor vehicle insurance, ownership, and financing (Q 163–186); motor vehicle speed, miles of travel, and accidents (Q 187–232); merchant vessels built, repaired, launched, and active (Q 438–480, Q 487–502)
R. Communications	53	Cable TV (R 98–101); radio and TV finances (R 113–120, R 130–137); new books published (R 195–217); newsprint consumption (R 218–223)
S. Energy	124	Consumption of raw materials and fuel resources (S 15–31); privately-owned electric utility generating plants and balance sheet and income items (S 58–73, S 133–146); REA summary of operations (S 147–159); waterpower (S 160–175); natural gas consumption and gas utility industry (S 178–218)
T. Distribution and Services	100	Annual earnings of full-time employees (T 29–42); legal form of organization of industries (T 43–57); merchant wholesalers sales and stocks (T 375–383); index of national advertising expenditures (T 472–484)
U. International Transactions and Foreign Commerce	155	Value of direct foreign investment in U.S. (U 47–74); U.S. Government foreign grants and credits (U 75–186); exports and imports, by broad end-use class (U 249–263)
V. Business Enterprise	115	Number of firms, by type of ownership (V 1–12); income of unincorporated firms (V 66–77); manufacturing and trade sales and inventories (V 78–107); gross product and unit costs of nonfinancial corporations

Summary of Selected New Series in This Edition—Con.

Chapter and title	Number of new series	Summary of selected new series
		(V 141–166); business expenditures for new plant and equipment (V 306–332)
W. Productivity and Technological Development	*60*	Indexes of output per man-hour and per employed person (W 22–29); funds for research and development (W 109–125, W 161–167); employment of natural scientists and engineers (W 168–180)
X. Financial Markets and Institutions	517	Flow of funds (X 1–392); sales of stocks and bonds on registered exchanges (X 517–530); savings and other time deposits, by institution (X 687–697); assets and liabilities of mutual savings banks and savings and loan associations (X 821–844); selected items of property-liability insurance (X 918–932); stock and mutual insurance companies (X 933–966)
Y. Government	158	Voter participation in presidential elections (Y 28–78); costs of presidential elections (Y 187–188); congressional bills vetoed (Y 199–203); Federal Government full-time civilian employment (Y 318–331); Federal grants to State and local governments (Y 638–651); selective service registrants (Y 917–926); defendants charged with violation of selective service acts (Y 927–942)
Z. Colonial and Pre-Federal Statistics	200	Population censuses taken in the colonies and States (Z 24–132); components of private wealth for the thirteen colonies (Z 169–191); exports to and imports from Scotland, by colonies and States (Z 227–244); commodity imports and exports, shipping earnings, and value of slaves imported (Z 286–290); vessels built in colonies and West Florida (Z 510–529)

Chapter A

Population

A 1–371. General note.

The principal source of population data is the Decennial Census of Population, a housc-by-house enumeration made by the Bureau of the Census. In accordance with a Constitutional provision for a decennial canvass of the population, the first census enumeration was made in 1790. The primary reason for the Census of Population, as set forth in the Constitution, is to provide a basis for the apportionment of Members of the House of Representatives atnong the several States. Until 1902, the census organization was temporary. It was assembled before each decennial census and disbanded after the work was finished. In 1902, the Bureau of the Census was established as a permanent agency of the Government, charged with responsibility for the decennial census and for compiling statistics on other subjects as needed. Currently (1978), this Bureau provides population data based on surveys and estimates in addition to malting the comprehensive decennial census enumeration.

In accordance with census practice dating back to 1790, each person is counted as an inhabitant of his usual place of residence or usual place of abode, that is, the place where he lives and sleeps most of the time. This place is not necessarily the same as his legal residence, voting residence, or domicile, although, in the vast majority of cases, the use of these different bases of classification would produce identical results. Indians living in Indian Territory or on reservations were not included in the population count until 1890, and in earlier censuses large tracts of unorganized and sparsely settled territory were not covered by enumerators. Alaska and Hawaii were territories through 1950 and were first included in the United States in the 1960 Census. Many tables in this chapter show two sets of 1960 data, one for the conterminous United States and one for the United States including Alaska and Hawaii.

Through 1930, the data presented are based on complete counts. Many of the data shown from subsequent censuses are based on sample tabulations (ranging from 3⅓ percent to 26 percent), as indicated in footnotes to the tables.

Several tables present data from the Current Populntion Survey, conducted monthly by the Bureau of the Census since 1947. Originally, the Survey covered a representative sample of approximately 21,000 interviewed households in areas throughout the United States. This sample was increased to approximately 35,000 in May 1966, and to approximately 50,000 in January 1967.

Exact agreement is not to he expected among the various samples, nor between them and the complete census count, but the sample data may be used with confidence where large numbers are involved, and may be assumed to indicate patterns and relationships where small numbers are involved. Detailed statements regarding the sampling errors are given in the original sources.

Many errors appear in the census publications of 1790–1840. The data for these censuses were adjusted by county and race, and the revised figures were published in the 1870 census. Revised figures by sex for the United States population by race for 1790–1840 were published in the 1910 census. Official revisions by age have not been made, and thus the 1790–1840 age data in this chapter for most race-sex groups add to totals which differ slightly from the revised figures for race-sex groups.

The Bureau of the Census has always been concerned about the degree of completeness of enumeration in the decennial censuses, although public interest in census coverage and statistical techniques for estimating coverage were quite limited prior to 1960. Discussions of coverage in earlier censuses were limited mostly to qualitative statements.

The quantitative evaluation of census coverage can be done at the individual and aggregate levels. At the individual level, the approaches include reinterview (e.g., postenumeration surveys) and record checks (e.g., matching of census records and birth records). At the aggregate level, the approaches include demographic analysis (i.e., the use of data on births, deaths, and migration, and of life tables, expected sex ratios, etc.) and the use of aggregated data from administrative records (e.g., comparing the enrollment in "Medicare" with the census count of *the* aged population).

In 1950, the postenumeration survey was thought to he a satisfactory method of determining net census underenumeration. The number missed in the 1950 census was estimated at about 2.1 million, or 1.4 percent with corresponding estimates of 1.6 percent for 1940 and 0.7 percent for 1930. However, demographers now generally believe chat postenumeration surveys tend to understate census omissions because persons missed in a census have an above-average probability of being missed in a postenumeration survey. Evaluations of census coverage now rely heavily on detnographic analysis. An analysis of coverage conducted in conjunction with the 1970 census shows the following estimates and revisions of net census underenumeration: for 1970, 5.3 million, or 2.5 percent; for 1960, 6.1 million, or 2.7 percent; for 1950, 5.1 million, or 3.3 percent. Analyses of census coverage are subject to revision on the basis of additional information and research.

While the earlier censuses no doubt were characterized by underenumeration, the amounts generally are difficult to determine. One technique is the comparison of rates of change with respect to consistency and reasonableness. On this basis, it is believed that figures for the South show unreasonably low rates of increase for the decade 1860–1870 and abnormally high rates of increase for 1870–1880. The differences are so great that it eppears evident that the enumeration of 1870 in this area was seriously incomplete, undoubteclly as a result of the unsettled conditions of the Reconstruction period. For the portion of the United States outside the South, the rate of increase for 1860–1870 was about the same as for 1870–1880. Therefore, the number initially enumerated in 1870 for the South wns revised upward. For a detailed discussion of the adjustment, see *U.S. Census of Population: 1890*, vol. I, pp. xi–xii.

For analyses of the completeness of census enumerations from 1880 to 1970, see the following sources. Ansley J. Coale and Melvin Zelnik, *New Estimates of Fertility and Population in the United Stales* (Princeton University Press, Princeton, New Jersey), 1963. Jacob S. Siegel, "Estimates of Coverage of the Population by Sex, Race, and Age in the 1970 Census," Demography, vol. 11, *No.* 1 (February 1974), pp. 1–23. Ansley J. Coale and Norfleet W. Rives, Jr., "A Statistical Reconstruction of the Black Population of the United States, 1880–1970: Estimates of True Numbers by Age and Sex, Birth Rates, and Total Fertility," *Population Index*, vol. 39, No. 1 (January 1973), pp. 3–36.

A 1–5. Area and population of the United States, 1790–1970.

Source: U.S. Bureau of the Census. 1790–1950, land area, U.S. *Census oj Population: 1960*, vol. *I*, part A, p. 1–4; gross area, *Historical Statistics of the United Slates, Colonial Times to 1967*, p. 8. 1960, land area and gross area, *Area Measurement Reports*, GE-20, No. 1, 1970, p. 5. 1970, land area and gross area, *U.S. Census of Population:* 1970, vol. I, part A, section 1, pp. 1–41, 1–42. 1790–1960, population, *U.S. Census of Population: 1960*, vol. I, part A, p. 1–4. 1970, population, *U.S. Census of Population: 1970*, vol. I, part A, section 1, pp. 1–37, 1–42.

Area figures for each census year represent the conterminous area under the jurisdiction of the United States, with the addition in 1960 and 1970 of Alaska and Hawaii. In some cases, large areas are included that were not yet settled or covered by the census. Area figures prior to 1940 have been adjusted to bring them into agreement with remeasurements made in 1940. For area measurements prior to 1940, see text for series A 210–266, For a further discussion of areas covered by the censuses, see *U.S. Census of Population: 1940, Areas ojthe United Slates: 1940,* and *U.S. Census of Population:* 1950, vol. I, p. XI. For a discussion of the revision of the 1870 census of population, see *U.S. Census of Population: 1890,* vol. I, pp. xi–xii.

A 6–8. Annual population estimates for the United States, 1790–1970.

Source: U.S. Bureau of the Census. 1790–1899, *Historical Statistics of the United Slates, Colonial Times to* 1857, p. 7; 1900–1970, *Current Population Reports,* series P-25, No. 499, pp. 11–12.

The estimates are as of July 1, and thus figures for the resident population for census years differ from decennial census populations. Estimates prior to 1900 are based on linear interpolation between decennial censuses. Estimates for the 1900–1919 period are based on interpolation techniques applied to census age data, Estimates for subsequent years are based on census data and information on births, deaths, and international migration. For a discussion of the methodology, see Bureau of the Census, *Current Population Reports,* series P-25, No. 311, pp. 1–3.

Estimates subsequent to the 1960 census are preliminary and are subject to revision on the basis of final estimates of births, deaths, and international migration for the 1960–1970 decade. These population estimates are controlled to 1970 census results, which are final, and thus subsequent revisions in the preliminary estimates will be small.

A 43–72. Number of places and population in urban and rural territory, by size of place, 1790–1970.

Source: U.S. Bureau of the Census. 1790–1960, *U.S. Census of Population:* 1960, vol. I, part A, pp. 1–13 to 1–15; 1970, *U.S. Census of Population:* 1970, vol. I, part A, section 1, p. 1–46.

The Bureau of the Census has employed several definitions of urban population. According to the definition adopted for use in the 1970 census, the urban population comprises all persons living in urbanized areas (see text for series A 82–90) and in places of 2,500 inhabitants or more outside urbanized areas. More specifically, the urban population consists of all persons living in (a) places of 2,500 inhabitants or more incorporated as cities, villages, boroughs (except Alaska), and towns (except in the New England States, New York, and Wisconsin), but excluding those persons living in the rural portions of extended cities; (b) unincorporated places of 2,500 inhabitants or more: and (c) other territory, incorporated or unincorporated, included in urbanized areas.

In censuses prior to 1950, the urban population comprised all persons living in incorporated places of 2,500 or more and areas (usually minor civil divisions) classified as urban under special rules relating to population size and density. The most important component of the urban territory in any definition is the group of incorporated places having 2,500 inhabitants or more. A definition of urban territory restricted to such places, however, would exclude a number of large and densely settled areas merely because they are not considered "incorporated places." Prior to 1950, an effort was made to avoid some of the more obvious omissions by inclusion of selected areas which were classified as urban under special rules. Even with these rules, however, many large and closely built-up areas were excluded from the urban territory,

To improve its measure of the urban population, the Bureau of the Census adopted, in 1950, the concept of the urbanized area and delineated, in advance of enumeration, boundaries for unincorporated places. With the adoption of the urbanized area and unincorporated place concepts for the 1950 census, the urban population was defined as all persons residing in urbanized areas and, outside these areas, in all places incorporated or Unincorporated, which had 2,500 inhabitants or more. With the following two exceptions, the 1950 definition of urban was continued substantially unchanged to 1960 and 1970. In 1960 (but not in 1970), certain towns in the New England States, townships in New Jersey and Pennsylvania, and counties elsewhere were designated as urban. However, most of the population of these "special rule" areas would have been classified as urban in any event because they were residents of an urbanized area or an unincorporated place of 2,500 or more.

In all urban and rural definitions, the population not classified as urban constitutes the rural population.

The first official publication of figures formally presenting the urban population was made following the Census of 1870 in the *Statistical Atlas of the United Slates.* The population of cities and towns of 8,000 inhabitants or more was presented as the "urban population." In the reports of the 1880, 1890, and 1900 censuses, the urban population was variously defined as the population living in places of 4,000 inhabitants or more, or 8,000 inhabitants or more. The first publication in which the population of places having 2,500 inhabitants or more was officially designated as urban was the *Supplementary Analysis of the Twelfth Census (1900),* published in 1906. This definition, with minor modifications, was used in later censuses up to and including 1940. For purposes of comparison, the data for 1950 were also tabulated in accordance with this urban definition.

A time series on the urban population since 1790 according to the 1940 definition of urban was published in the 1940 census. These data are shown in series A 43–56 and A 57–72. Data on the urban population by selected characteristics are not always available on this basis, and thus the total urban populations shown in other tables may differ slightly.

For detailed discussions of the urban definitions used up to 1940 and of the major changes implemented in 1950, see Bureau of the

Census, *Current Population Reports,* series P-23, No. 1, "The Development of the Urban–Rural Classification in the United States: 1874 to 1949," and U.S. *Census of Population: 1950,* vol. I, pp. xv–XVIII.

The rural population is subdivided into rural farm and rural nonfarm components. In 1960 and 1970, the farm population was defined as persons living on places of 10 or more acres from which sales of farm products amounted to $50 or more in the preceding calendar year or on places of fewer than 10 acres from which sales of farm products amounted to $250 or more in the preceding year. In 1950, the farm population was defined as all persons living on farms and depended on the respondent's conception of farm (or ranch) with the exception that persons living on what might have been considered farmland were classified as nonfarm if they paid cash rent for their homes and yards only. In 1930 and 1940, the farm population comprised all persons living on farms and depended primarily upon the interviewer's conception of what was meant by the word farm. In 1920, the farm population comprised all persons living on farms and those farm laborers (and their families) who, while not living on a farm, lived in rural, unincorporated territory. Farms were defined in 1920 (as in the census of agriculture) to include all tracts of 3 acres or more used for agricultural purposes and smaller tracts which produced as much as $250 worth of farm products in 1919 or required for their agricultural operations the continuous services of at least one person.

For further discussion, see *U.S. Census of Population: 1980,* vol. II, p. 8; *U.S. Census of Population: 1950,* vol. II, part 1, pp. 33–35; *U.S. Census of Population: 1960,* vol. I, part 1, pp. XXXVII–XXXVIII. See text for series A 43–56 for the definition of urban and rural. See text for series A 91–104 for the definition of race.

A 82–90. Urban population, by type of residence, sex, and race, **1950–1970.**

Source: U.S. Bureau of the Census. 1950, all races and white, *U.S. Census of the Population: 1960,* vol. I, part 1, p. 143; 1950, Negro and other races, *U.S. Census of Population: 1950,* vol. IV, part 5, chapter A, pp. 16–18. 1960, *U.S. Census of Population: 1960,* vol. I, part 1, p. 144; parts 3 and 13, p. 17. 1970, *U.S. Census of Population: 1970,* vol. I, part 1, section 1, p. 262.

The first systematic attempt to define the metropolitan population of the United States was presented in the 1910 census in which Metropolitan Districts were defined for cities of 200,000 or more. Each Metropolitan District included contiguous minor civil divisions which met certain rules of proximity and population density. The Metropolitan District concept was used with changes in definition up through the 1940 census, when Metropolitan Districts were defined for cities of 50,000 or more. Metropolitan Districts were seldom cross-tabulated with census data on social and economic characteristics and thus were of limited usefulness.

In 1950, Metropolitan Districts were replaced in census reports by Standard Metropolitan Areas (see text for series A 267–278) and Urbanized Areas. Urbanized Areas, with minor changes in definition, were delineated in the 1950, 1960, and 1970 censuses. In general, an Urbanized Area is defined as a city of 50,000 or more (or twin cities meeting this criterion) and surrounding closely settled areas, including incorporated places and unincorporated territory. The urban population can be divided into the Urbanized Area population and the Other Urban population. The Urbanized Area population can be further divided into Central City and Urban Fringe components.

For a further discussion, see the following sources: U.S. *Census of Population: 1910,* vol. I, pp. 73–77; *U.S. Census of Population: 1930, Metropolitan Districts; U.S. Census of Population: 1940, The Growth of Metropolitan Districts in the United States: 1900–1940; U.S. Census of Population: 1950,* vol. I, pp. XXVII–XXVIII; *U.S. Census of Population: 1970,* vol. I, part A, section 1, p. XIII.

See text for series A 43–56 for definition of urban and rural. See text for series A 91–104 for definition of race.

A 91–104. Population, by sex and race, **1790–1970.**

Source: U.S. Bureau of the Census. 1790–1920, *U.S. Census of Population:* 1980, vol. II, p. 107; slave population, *U.S. Census of Population: 1870,* vol. I, p. 7. 1930–1960, *U.S. Census of Population: 1960,* vol. I, part 1, pp. 144–145. 1970, U.S. *Census of Population: 1970,* vol. I, part 1, section 1, p. 262.

The classification of the population by race reflects common usage rather than an attempt to define biological stock. As a result, the white and Negro populations usually have not been divided into racial subgroups (although the white population has been classified by ethnic origin), but American Indians and some Asian groups (e.g., Japanese, Chinese, Filipino, Korean, etc.) have typically been identified with country of origin.

Through 1960, the classification of the population by race was usually obtained by the enumerator's observation. Persons of mixed white and other parentage were usually classified with the other race. A person of mixed parentage other than white was usually classified by the race of his father, except that mixtures of Negro and Indian were classified as Negro unless the Indian stock was clearly predominant or unless the individual was accepted in the community in which he resided as an Indian.

The category Indian included unmixed American Indians together with persons who were of mixed white and Indian Ancestry if they were enrolled on an Indian reservation or agency roll. Persons who were part Indian were included as Indian if they were one-fourth or more Indian, or if they were regarded as Indians in the community in which they resided.

In the 1960 census, data on race were collected by a combination of self-classification, direct interview, and observation by the enumerator; the classification rules were essentially the same as in 1950.

In the 1970 census, data on race were obtained primarily through self-classification. In a change from earlier censuses, a person of mixed white and other parentage who was in doubt as to his classification was classified according to the race of his father. It is believed that self-identification of race may lead to a somewhat higher proportion of the population being classed in the "Other races" category than does observation by the enumerator.

In the 1930 census, persons of Mexican origin were included with "Other races"; however, the tables in this volume have been revised to include Mexicans in the white population.

In the 1970 census, the edit and review of questionnaires were not completed when the complete-count data were processed. As a result, some information which pertained to nationality or ethnicity was accepted as identifying race. For example, some persons who classified themselves in the race item as Mexican or Spanish American were thus included in the "Other races" population, but should have been included in the white population. In the tabulation of sample data, this error was corrected. The result in the case of 20-percent sample data was that the population of "Other races" was reduced from 2,882,662 to 2,555,872 (1,270,625 males and 1,285,247 females), or by 826,790, which is roughly the amount added to the white population in the sample tabulations.

The Census of 1860 was the first in which Indians were distinguished from other classes in the population. Prior to 1890, enumeration of

Indians was limited to Indians living in the general population of the various States; Indians in Indian Territory and on Indian reservations were excluded. In 1910, a special effort was made to secure a complete enumeration of persons with any perceptible amount of Indian ancestry. This probably resulted in the enumeration as Indian of a considerable number of persons who would have been reported as white in earlier censuses, There were no special efforts in 1920, and the returns showed a much smaller number of Indians than in 1910. Again in 1930, emphasis was placed on securing a complete count of Indians, with the result that the returns probably overstated the decennial increase in the number of Indians.

For further discussion of race in census statistics, see *U.S. Census of Population: 1950,* vol. II, part 1, pp. 35–36; *1960,* vol. I, part 1, pp. XLI–XLIII; *1970,* vol. I, part 1, section 2, pp. App. 15–16.

A 105–118. Foreign born population, by sex and race, 1850–1970.

Source: U.S. Bureau of the Census. 1850 and 1870, *U.S. Census of Population: 1870,* vol. I, pp. 606–609, 614–615. 1860, white, *U.S. Census of Population: 1930,* vol. II, p. 97. 1860, all races and Negro, *U.S. Census of Population: 1870,* vol. I, pp. 610–613. 1880, *U.S. Census of Population: 1880,* vol. I, pp. 542–545. 1890, all races and white, *U.S. Census of Population: 1890,* vol. I, part 1, pp. 486–487. 1890, other races, *U.S. Census of Population: 1900,* vol. 11, part II, p. xvii. 1900–1940, *U.S. Census of Population: 1940,* vol. II, p. 19. 1950, *U.S. Census of Population: 1950,* vol. II, part 1, p. 171. 1960, US. *Census of Population: 1960,* vol. I, part 1, p. 354; part 3, p. 118; part 13, p. 115. 1970, *U.S. Census of Population: 1970,* vol. I, part 1, section 2, pp. 593–596.

The native born population is comprised of persons born in the United States, or in outlying areas of the United States (see series A 9–22) and persons born elsewhere to United States citizens. The remainder of the population is foreign born. Through 1950, persons for whom place of birth was not reported were included in the native population. In 1960 and 1970, such persons were classified as native unless their census report contained contradictory information, such as an entry of a language spoken prior to coming to the United States.

The outlying areas are as defined at each census. Thus, persons born in the Philippines (which was granted independence in 1946) were classified as native born in 1940 and foreign born in 1950.

A 119–134. Population, by age, sex, race, and nativity, 1790–1970.

Source: U.S. Bureau of the Census. (1) For all races, white, Negro, other races, free Negro, and slave: 1790–1840, *U.S. Census of Population: 1840,* Compendium (Blair and Rives edition), pp. 96–98, 366–371. 1850–1870, *U.S. Census of Population: 1870,* vol. II, pp. 552–558. 1880–1950, all races and white, *U.S. Census of Population: 1950,* vol. II, part 1, pp. 93–94. 1890–1930, Negro, *U.S. Census of Population: 1930,* vol. II, p. 580. 1890–1930, other races—by subtraction of Negro (as cited) from Negro and other races (*U.S. Census of Population: 1950,* vol. II, part 1, pp. 93–94). 1940, Negro and other races, *U.S. Census of Population: 1940,* vol. II, part 1, p, 22, 1950, Negro and other races, *U.S. Census of Population: 1950,* vol. I, part 1, pp. 153–154; parts 3 and 13, pp. 23–24. 1960, Negro and other races, *U.S. Census of Population:* 1960, vol. I, part 1, p. 359; part 3, p. 117; part; 13, p. 113. 1970, *U.S. Census of Population: 1970,* vol. *I,* part 1, section 1, pp. 269–296. (2) For foreign-born white: 1870, *U.S. Census of Population: 1870,* vol. II, p. 553. 1880, *U.S. Census of Population: 1880,* vol. I, pp. 549, 551. 1890–1950, *U.S. Census of Population: 1950,* vol. IV, part 3, chapter A, p. 16. 1960, *U.S. Census of Population: 1960,* vol. *I,* part 1, pp. 354, 359. 1970, *U.S. Census of Population: 1970,* vol. I, part 1, section 2, p. 591.

The censuses of 1790–1840 contain numerous inconsistencies and other errors. Total population by race (including a division of the Negro population into free and slave) for each State and county were corrected in *U.S. Census of Population: 1870,* vol. I, pp. xliv–xlix, 3–8. Adjusted totals by sex appear in *U.S. Census of Population: 1920,* vol. 11, p. 107; however, the age data were not adjusted, and thus the totals in series A 119–134, which are consistent with the age data shown, differ slightly in some cases from the totals in series A 91–104.

See text for series A 91–104 and A 105–118 for definitions of race and nativity.

A 135–142. Native born white population, by sex and parentage, 1850–1970.

Source: U.S. Bureau of the Census. 1850–1880, *U.S. Census of Population: 1930,* vol. II, pp. 33, 97. 1890–1930, *U.S. Census of Population: 1950,* vol. IV, part 3, chapter A, p. 11. 1940, parentage, *U.S. Census of Population: 1940,* Nativity and Parentage of the White Population, p. 7; total native population, *U.S. Census of Population: 1940,* vol. II, part 1, p. 19. 1950, *U.S. Census of Population: 1950,* vol. IV, part 3, chapter A, p. 11. 1960, parentage, *U.S. Census of Population: 1960,* PC(2)–1A, p. 2; total native population, *U.S. Census of Population: 1960,* vol. I, part 1, pp. 354, 359. 1970, *U.S. Census of Population: 1970,* Final Report PC(2)-1A, *National Origin and Language,* p. 1.

The procedures for determining the nativity of parents are generally the same as those for determining the nativity of the individual himself. The native-born population can be subdivided into native born of native (American) parents, native born of mixed parentage (one American parent and one foreign-born parent), and native born of foreign parentage (both parents foreign born).

The figures for total native-born population in series A 135–142 and the figures for foreign-born population in series A 105–118 for each year are from the same census count or sample. For 1850–1940, these are complete-count data which add to the totals in series A 91–104. For 1950–1970, these are sample data which do not agree with the totals in A 91–104.

Similarly, the figures by parentage in A 135–142 for each year are from the same census count or sample, For 1870–1930, these are complete-count data which add to the totals in A 135–142. For 1940–1970, these are sample data which add to the totals in A 135–142 only when all figures are from the same tabulation of the same sample.

A 143–157. Mcdinn age of the population, by race, sex, and nativity, 1790–1970.

Source: Derived from series A 119–134.

The median age is that age which divides the population into two equal groups, one half being older and one half being younger. Medians have been computed on the basis of the population for which age is available and on the assumption that population is evenly distributed within the age groups shown in series A 119–134. In most cases, the median falls in a 5-year age group, and the assumption of linearity introduces little error. In cases where the median falls near the center of a large age span (e.g., Negro in 1830 and 1840), this assumption may introduce considerable error. The fluctuations in median ages for the "Other races" population are due in part to changing race composition (e.g., the majority of the Indian population was not included in tabulations by age until 1900).

A 158–159. Median age at first marriage, by sex, 1890–1970.

Source: U.S. Bureau of the Census, *Current Population Reports,* series P-20, No. 242, "Marital Status and Living Arrangements: March 1972," p. 2.

The median age at first marriage, as shown here, is an approximation derived indirectly from tabulations of marital status and age. (See source for detailed explanation of computation procedures.) These estimates differ from those based on annual marriage records or census questions on age at first marriage. The median age at

first marriage shown here can be interpreted as applying to the cohort born "n" years earlier, where "n" is the median age at first marriage. Estimates from 1947 to 1970 are subject to sampling variability.

A 160–171. Marital status of the population, by age and sex, 1890–1970.

Source: U.S. Bureau of the Census. 1890–1950, *U.S. Census of Population: 1950*, vol. II, part 1, pp. 179–181; 1960, *U.S. Census of Population: 1960*, vol. I, part 1, pp. 424–425; 1970, *U.S. Census of Population: 1970*, vol. I, part 1, section 2, pp. 640–641.

Marital status (single, married, widowed, and divorced) represents the status of persons at the time of the enumeration. Persons classified as "married" include those who have been married only once, remarried after having been widowed or divorced, separated, and living in common-law marriages. Persons reported as never married or with annulled marriages are classified as single. Since it is probable that some divorced persons are reported as single, married, or widowed, the census figures may understate somewhat the actual number of divorced persons who have not remarried.

A 172–194. Population of regions, by sex, race, residence, age, and nativity, 1790–1970.

Source: U.S. Bureau of the Census. Series A 172 and A 178–179, *U.S. Census of Population: 1970*, vol. I, part A, tables 8 and 18. II, parts 1–7, table 4; 1950, *U.S. Census of Population: 1950*, vol. II, table 54.

The divisional and State composition of census regions is as follows:

Northeast Region:
- New England Division:
  - Maine
  - New Hampshire
  - Vermont
  - Massachusetts
  - Rhode Island
  - Connecticut
- Middle Atlantic Division:
  - New Yorlc
  - New Jersey
  - Pennsylvania

North Central Region:
- East North Central Division:
  - Ohio
  - Indiana
  - Illinois
  - Michigan
  - Wisconsin
- West North Central Division:
  - Minnesota
  - Iowa
  - Missouri
  - North Dakota
  - South Dnkotn
  - Nebraska
  - Knnsas

South Region:
- South Atlantic Division:
  - Delaware
  - Maryland
  - District of Columbia
  - Virginia

South Region—Con.
- South Atlantic Division—Con
  - West Virginia
  - North Cnrolina
  - South Carolina
  - Georgia
  - Florida
- East South Central Division:
  - Kentucky
  - Tennessee
  - Alabama
  - Mississippi
- West South Central Division:
  - Arkansas
  - Louisiana
  - Oklahoma
  - Texas

West Region:
- Mountain Division:
  - Montnna
  - Idaho
  - Wyoming
  - Colorado
  - New Mexico
  - Arizona
  - Utah
  - Nevada
- Pacific Division:
  - Washington
  - Oregon
  - California
  - Alaskn
  - Hawaii

A 210–263. Land area of the United States, by States and territories, 1790–1970.

Source: U.S. Bureau of the Census. 1790–1920, *Fourteenth Census of the United States: 19220*, vol. I, *Population*, table 14; 1930, *Fifteenth Census of the United States, 1930*, vol. I, *Population*, table 7; 1940, *Sixteenth Census of the United States: 1940, Areas of the United States, 1940*, table 1; 1950, *Census of Population: 1950*, vol. II, *Characteristics of the Population*, part 1, U.S. Summary, tabfe 9; 1960, *Area Measurement Reports, 1960*, series GE-20; 1970, *U.S. Census of Population: 1970*, vol. I, part 1, section 1, table 11.

Area measurements of the States and former territories rest on three periods of measurement. The first period is for the 1880 Census of Population when, under Henry Gannett, Census Geographer, "the foundation for accurate and detailed area measurement in the United States" was laid (Proudfoot, *Measurement of Geographic Area*, 1946, p. 27). The second period is for the 1940 census when, under Batschelet and Proudfoot, a basic remeasurcment of all the areas was accomplished, which still remains the basis for subsequent remeasurements. The third period was during the 1960's when remeasurements of land and water areas based on the 1940 total or gross areas were undertaken with the use of recent maps and greatly improved measurement techniques.

Remeasurements of land and water areas between and since those three periods occurred but they were largely in terms of adjusting the earlier figures because of relatively minor boundary changes or because of land and water changes resulting mainly from the construction of known dams and reservoirs.

According to the 1940 definitions of land and water areas (used also in the 1960's), ponds, lakes, or similar areas were counted as inland water if their areas were 40 acres or more; streams and canals had to be ⅛-mile or more in width to be counted. All other areas were tabulated as land with the exception of "water other than inland water" such as the Great Lakes, coastal waters, bays, etc. The definitions were based on maps, not on inspection of the surface of the earth. Accordingly, features such as new reservoirs which were not shown in the maps used in the measurement work were reported as land rather than water.

The land areas shown for the United States, which are consistent with data available for States and territories, differ slightly from the figures shown in series A 1–5. The latter figures reflect adjustments made only at the national level in conjunction with remeasurements made in 1940.

A 264–275. Number and population of standard metropolitan statistical areas, as defined in **1950, 1960,** and **1970, by** region and size, **1950–1970.**

Source: U.S. Bureau of the Census. 1950 delineations, *U.S. Census of Population: 1950,* vol. I, pp. 1–66 to 1–73; 1960 delineations, *U.S. Census of Population: 1960,* vol. I, part A, pp. 1–100 to **1–111;** 1970 delineations, *U.S. Census of Population: 1970,* vol. I, part A, section 1, pp. 1–171 to 1–186.

Standard Metropolitan Areas (SMA's) were first defined in conjunction with the 1950 census. The concept was continued with some changes in definition in the 1960 and 1970 censuses, although the title was changed to Standard Metropolitan Statistical Areas (SMSA's). (For a discussion of other definitions of the metropolitan population, see text for series A 82–90).

Except in the New England States, a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are socially and economically integrated with the central county. In the New England States, SMSA's consist of towns and cities instead of counties. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. The population of SMSA's can be divided into the portions living Inside Central Cities and Outside Central Cities. For a detailed description of the official criteria for defining SMSA's in the 1970 census, see Bureau of the Budget (now US. Office of Management and Budget), *Standard Metropolitan Statistical Areas: 1967.*

Urbanized Areas, as discussed in the text for series A 82–90, and SMSA's differ considerably. An Urbanized Area represents the physical or continuously built-up urban area without regard for political boundaries. SMSA's conform to political boundaries. It is thus possible to assemble historical series for SMSA's as defined at a specified time; however, SMSA's include substantial rural population, especially when the current definition is used to present information for an earlier date. In 1970, 12 percent of the SMSA population was rural, and 30 percent of the rural population of the United States was included in SMSA's. See *U.S. Census of Population: 1970,* vol. I, part 1, section 1, pp. 1–206 to 1–212. For a discussion of the criteria for defining SMSA's and the inconsistencies in the application of these criteria, see Ira Rosenwaike, "A Critical Examination of the Designation of Standard Metropolitan Statistical Areas," *Social Forces,* vol. 48, No. 3 (March 1970), pp. 322–333.

A 276–287. Population of standard metropolitan statistical areas, by region, size, and race, **1950–1970.**

I, parts 2–52 (State reports), table 21; 1970, *U.S. Census of Population: 1970,* vol. I, parts 2–50 (State reports), table **23.**

A 288–319. Households, families, subfamilies, married couples, and unrelated individuals, **1790–1970.**

Source: US. Bureau of the Census. 1790–1880, Twelfth Census Special Reports, *A Century of Population Growth, 1790–1900;* 1890–1930, *U.S. Census of Population: 1950,* vol. IV, Special Reports, *General Characteristics of Families;* 1940–1970, *Current Population Reports,* series P-20, Nos. 176 and **251.**

According to the 1970 Census Bureau definition, a household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants. A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing; unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household.

Households classified as having a male head include those where the head of the household is a married man whose wife lives with him and all other households with a male designated as head. Female household heads include women who are not married or not living with their husbands and who are designated as household heads.

The count of households excludes group quarters (referred to as "quasi-households" in the previous edition of *Historical Statistics*), which are living arrangements for institutional inmates, regardless of the number of inmates, or for other groups containing 5 or more persons unrelated to the person in charge.

The figures for number of households are not strictly comparable from year to year. In general, the definitions of household for 1790, 1900, 1930, 1940, 1950, 1960, and 1970 are similar. Very minor differences result from the fact that in 1950, 1960, and 1970, housing units with 5 or more lodgers were excluded from the count of households, whereas in 1930 and 1940, housing units with 11 lodgers or more were excluded, and in 1790 and in 1900, no precise definition of the maximum allowable number of lodgers was made. The definition of household for 1850–1890, 1910, and 1920 differs slightly from that given above. For these years, no distinction was made between households and group quarters (quasi-households), and thus the numbers include both households and group quarters.

In 1950–1970, the number of households was equal, by definition, to the number of occupied housing units enumerated for housing statistics. In 1940, the definition of household was not completely the same as that of occupied housing units. In that year there were 95,000 more households than occupied housing units.

Average size figures were computed by dividing the total population (the total free population for 1790, 1850, and 1860) by the number of household heads. The number of household heads for 1850–1890, 1910, and 1920 also includes the heads of group quarters (quasi-households). Since these are such a small fraction of the total number of household heads, the population per household is only slightly affected by a change in definition for these years.

Data for families are shown only for 1940 and later years. Prior to 1940 the concept of "family" was basically synonymous with the present concept of "household" wherein a family comprised the head of a household and all other members of the household related to the head. Under this definition, a head of a household living alone was counted as a family but a mutually related group of lodgers or resident employees was not counted as a family.

The term "family," as shown here, refers to a group of two or more persons related by blood, marriage, or adoption and residing together in a household. A primary family consists of the head of a household and all other persons in the household related to the head. A secondary family comprises two or more persons such as guests, lodgers, or resident employees and their relatives, living in a household and related to each other.

A subfamily is a married couple with or without children, or one parent with one or more unmarried children under 18 years old, living in a household and related to, but not including, the head of the household or his wife. Members of a subfamily are also members of the primary family with whom they live. The number of subfamilies, therefore, is not included in the number of families.

A married couple is defined as a husband and his wife living together in the same household, with or without children and other relatives.

Unrelated individuals refers to persons (other than inmates of institutions) who are not living with any relatives. A primary individual is a household head living alone or with nonrelatives only. A secondary individual in a household is a person such as a guest, lodger,

or resident employee who is not related to any other person in the household. Persons in group quarters, except inmates of institutions, are classified as secondary individuals.

Selected data for 1940–1970, which are from the *Current Population Reports*, have been revised on the basis of new population controls from the 1960 and 1970 censuses. The revisions have been made only for series A 288–319 and A 353–358 and, therefore, the data, especially for 1961–1970, are not comparable with those in series A 320–334, A 335–349, and A 350–352.

See text for series A 288–319 for definition of household, and A 43–56 for definition of residence.

Data for 1900–1946 represent estimates of the number of married women with their spouses in their own households, and the number of household heads in the remaining population. These estimates were based on available census and survey data and on additional information on construction activity, vacancy rates, marriage rates, divorce rates, economic indexes, etc. Although the figures are shown as of a given date, they should be regarded as an approximation of the annual average number of households.

The estimates by residence were made by subdividing the total into farm and nonfarm components, using estimates of the average size of farm households in conjunction with annual estimates of the farm population (see joint report of Bureau of the Census and Bureau of Agricultural Economics, *Estimates of the Farm Population: 1910 to 1950*, series Census-BAE, No. 16A). Since the annual changes in the number of households which are implied in these series may be subject to substantial sampling variability, caution should be used in the interpretation of small changes.

The farm household series for 1910–1946 relates to the total farm population, whereas that for 1947–1970 relates to the rural-farm population. There were 88,000 urban-farm households in 1940 and 96,000 in 1950.

A 353–358. Families and percent distribution of own children under 18 years old, **1950-1970.**

Data for 1955–1970 have been revised on the basis of new population controls from the 1960 and 1970 censuses.

A 359–371. Inmates of institutions, by sex, race, age, and type of institution, **1940–1970.**

Source: U.S. Bureau of the Census. 1940, *U.S. Census of Population: 1940, Institutional Population*, p. 10; 1950, *U.S. Census of Population: 1950*, vol. IV, part 2, chapter C, Institutional Population, pp. 15–17; 1960, *U.S. Census of Population: 1960*, Final Report PC(2)-8A, *Inmates of Institutions*, pp. 3–5, 7, and 12; 1970, *U.S. Census of Population: 1970*, Final Report PC(2)-4E, *Persons in Institutions and Other Group Quarters*, pp. 2–3, 5, 7, 11, and 21.

In the 1970 census, "inmates of institutions" were defined as persons under care or custody in institutions at the time of enumeration, regardless of their length of stay in that place and regardless of the number of people in that place. Statistics shown in this table for 1960 are based on similar criteria with the exception of "length of stay" as a criterion for defining inmates in 1960. Differences in the classification and definition of inmates between the 1950 and 1960 censuses are minimal and, thus, the estimates for both dates are comparable. However, several major differences exist between the estimates of inmates for 1940 and those for later years: In 1940 the coverage of inmates was for the population 14 years old and over rather than for all ages; inmates in tuberculosis hospitals were excluded from the 1940 inmate count; and a more detailed classification of inmates in homes for the aged and dependent was designed following the 1940 census which enabled enumerators in subsequent censuses to increase the field coverage in this area, particularly with respect to such places as commercial boarding homes for the aged, and rest, convalescent, and nursing homes.

Although data on types of institutions are generally comparable for each year shown, it should be noted that the use of progressively refined techniques to identify types of institutions in each census since 1940 has resulted in more inclusive and definitive classification of these types.

★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the ***Statistical Abstract of the United States***, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the ***Abstract***, see Appendix I in the ***Abrtruct.***

[1] Alaska and Hawaii included with outlying areas through 1950 and with United States thereafter. Alaska's population not enumerated in 1870 census.
[2] Excludes U.S. citizens temporarily abroad on private business, travel, etc.
[3] Estimates derived by extrapalation and interpolation of censuses of 1903, 1918, and 1939. The Philippines became independent in 1946.
[4] Official 1970 resident population. See series A 1-5, footnote 3.
[5] Includes Midway (2,220), Wake (1,647), Johnston (1,007), and Swan (22) Islands.
[6] Population as of 1958 census.
[7] Includes Midway (2,356), Corn (1,872), Wake (1,097), Canton (320), Johnston (156), and Swan (28) Islands.
[8] Estimate based on 20-percent sample of reports received.
[9] Estimated civilian population as of June 30 1950.
[10] Includes Corn (1,304), Midway (416), Wake (349), Canton (272), Johnston (46), and Swan (36) Islands.
[11] Census taken as of October 1 of preceding year.
[12] Includes Corn (1,523), Midway (437), Johnston (69), Canton and Enderbury (44), and Baker, Howland, and Jarvis (10) Islands.
[13] Population for Midway Islands.
[14] Population as of 1917 census.
[15] Population as of 1912 census.
[16] Population as of 1899 census.
[17] Population as of 1901 census.

Series A 23–28. Annual Estimates of the Population, by Sex and Race: 1900 to 1970

[In thousands. As of July 1. 1900-1939, resident population; 1940-1970, total population, including Armed Forces overseas. 1960-1970, preliminary; for description of estimates, see text for series A 6-81

Year	Total	Sex: Male	Sex: Female	Race: White	Race: Negro	Race: Other

- Represents zero.

[1] In 1970, relatively sparsely settled portions of certain incorporated places were classified as rural. The size class to which these places were assigned, however, was based on the population of the places within their legal boundaries.

[2] In 1930 each pair of the following was counted as a single place: Bluefield, Va., and Bluefield, W. Va.; Bristol, Tenn., and Bristol, Va.; Delmar, Del., and Delmar, Md.; Harrison, Ohio, and West Harrison, Ind.; Junction City, Ark., and Junction City, La.; Texarkana, Ark., and Texarlcana, Tex.; Texhoma, Okla., and Texhoma, Tex.; and Union City, Ind., and Union City, Ohio. In all other years they were counted as separate incorporated places.

[3] Erroneously excludes Williamsburgh Village, New York, from the count of urban places. See series A 57–72, footnote 3.

Series A 57–72. Population in Urban and Rural Territory, by Size of Place: 1790 to 1970

[In thousands. For U.S. total population, see series A 2. For definition of urban, see text for series A 43–56]

– Represents zero.

[1] In 1970, relatively sparsely settled portions of certain incorporated places were classified as rural. The population of these portions was excluded from the items under "Urban" and included in "Other rural." The size class to which these places were assigned however, was based on the population of the places within their legal boundaries. Excludes 23,377 persons for whom urban-rural residence is not available. See series A 1-5, footnote 3.

[2] Excludes 1,260,078 persons for whom urban-rural residence is not available. See series A 1-5, footnote 5, and text for series A 1-5.

[3] Erroneously excludes population (30,780 in 1850 and 5,094 in 1840) of Williamsburgh Village, New York.

Series A 73–81. Population, by Type of Residence, Sex, and Race: 1880 to 1970

[For definition of urban, see text for series A 43-56; for definition of rural farm, see text for series A 73-81]

* Denotes first year for which figures include Alaska and Hawaii.

[1] Sex not reported before 1820. Total for both sexes: 1790—757,208; 1800—1,002,037; 1810—1,377,808. Total slave population: 1790—697,681; 1800—893,602; 1810—1,191,362; 1820—1,538,022; 1830—2,009,043; 1840—2,487,355; 1850—3,204,313; 1860—3,953,760. For slave population by sex, 1820–1860, see series A 119–134.

[2] Includes races not shown separately, of which Filipinos are most numerous. Filipino males: 1910—144, 1920—5,232; 1930—42,268; 1940—39,723; 1950—46,101; 1960 (conterminous U.S.)—67,351; 1960 (including Alaska and Hawaii)—112,286; 1970—189,498. Filipino females: 1910—16; 1920—371; 1930—2,940; 1940—5,840; 1950—15,535, 1960 (conterminous U.S.)—39,075; 1960 (including Alaska and Hawaii)—64,024; 1970—153,562.

[3] Thb population of other races (i.e., neither white nor Negro) was overstated by about 327,000 in the 1970 census. See text for series A 91–104. Excludes 23,372 persons for whom sex and race are not available. See series A 1–5, footnote 3.

[4] Revisions to include adjustments for underenumeration in the Southern States show a total (both sexes) of 34,337,292 for white and 5,392,172 for Negro.

[5] Data by sex not available. See series A 1–5 for total population.

* Denotes first year for which figures include Alaska and Hawaii.

NA Not available.

[1] Includes races not shown separately, of which Filipinos are most numerous. Filipino males: 1960 (including Alaska and Hawaii,)—66,226; 1970—101,051; Filipino females: 1960 (including Alaska and Hawaii)—22,579; 1970—77,919.

[2] 15-percent sample data. These data vary in degree of comparability with data on total population by race. See text for series A 91–104.

[3] 25-percent sample data.

[4] 20-percent sample data. Complete-count data available only for the white population.

[5] Complete-count data: Males—5,176,390; females—4,984,778.

[6] Data for specific races in the Negro and Other races grouping are based on various samples and are extremely unreliable. See *Census* of *Population:* 2950, vol. IV, part 3, chapter B.

[7] Excludes population enumerated in the Indian Territory and on Indian reservations (totaling 325,464) which was not classified by nativity. Totals by race and sex: Males—169,221; females—156,243; white males—64,047; white females—53,321; Negro males—10,042; Negro females—8,594; Indian males—95,119; Indian females—94,328; Chinese males—13.

*Data by sex not available. Totals for both sexes: Negro—19,979; Indian—1,235; Japanese—1,921; Chinese—104,545.

[9] Excludes 1,260,078 persons for whom data on nativity are not available. See series A 1–5, footnote 8.

[10] Free Negroes only. Data on nativity were not collected for slaves.

Series A 119–134. Population, by Age, Sex, Race, and Nativity: 1790 to 1970

[Age at last birthday, except for 1890, which is age at nearest birthday. For 1940–1970, age not reported was allocated on the basis of other characteristics]

* Denotes first year for which figures include Alaska and Hawaii.
– Represents zero.
[1] Excludes 23,312 persons for whom age is not available. See series A 1–5, footnote 3.
[2] Exclusive of 325,464 persons enumerated in the Indian Territory and on Indian reservations. See series A 105–118, footnote 7, for composition by race and sex.
[3] Excludes 1,260,078 persons (741,915 white and 512,163 Negro) for whom age is not available. See series A 1–5, footnote 5, and series A 91–104, footnote 4.
[4] Totals differ slightly from corrected totals shown in series A 91–104. Corrections by age are not available. See *U.S. Census of Population: 1870*, vol. I, pp. xliv-xlix, and 3–8.
[5] 10–15 years old.
[6] 16–25 years old.
[7] 26–44 years old.
[8] Under 16 years old.
[9] 16 years old and over
[10] Age for 1190 available only for white males.
[11] 15-percent sample data.
[12] 25-percent sample data.
[13] 20-percent sample data.
[14] Estimates based on population under 15 and age distribution of Negro and other races.
[15] Aae for 1880 available only for all races. white. and for Nemo and other races combined.
[16] 10–23 years old.
[17] 24–35 years old.
[18] 36–54 years old.
[19] Under 14 years old.
[20] 14–25 years old.

* Denotes first year for which figures include Alaska and Hawaii.

[1] 15-percent sample data. These data are not entirely comparable with data on total white population, by sex. See text for series A 91–104.

[2] 25-percent sample data. Total native, and data by parentage, are from different tabulations.

[3] 20-percent sample data.

[4] Complete-count data for by sex; 5-percent sample data for parentage.

[5] Excludes population enum in the Indian Territory and on Indian reservati (luding 64,047 white males and 53,321 nite females) not classified by nativity.

[6] Totals for both sexes: Foreign parentage—8,085,019; mixed parentage—3,418,656.

[7] Data not available by sex. Totals for both sexes: Native parentage—28,568,424; foreign parentage—6,868,769; mixed parentage—1,911,098.

[8] Excludes 747,915 white persons for whom data on nativity are not available. See series A 1–5, footnote 5, and series A 91–104, footnote 4.

[9] Data not available by sex. Totals for both sexes: Native parentage—22,771,397; foreign parentage—4,167,098; mixed parentage—1,157,170.

– Represents zero. Z Less than 500.

[1] For 1790–1310, white persons only. [2] Series A 178 and A 179, 1950–1910, based on current definition of urban and rural; 1790–1940, based on 1940 definition. Series A 180–183, 1950–1970, based on current definition; 1930–1940, based on 1940 definition and 1900–1920 based on 1920 definition. See text for series A 43–56.

[3] Includes 5,602 persons for whom sex, race, and age detail are not available.

[4] Sex and age detail for the Dakota Territory not available.

[5] Age detail excludes all persons residing in Indian Territory or on Indian reservations. [6] Total population series A 172, and urban and rural population, series A 178 and A 179, include Aiaska beginning 1890, and Hawaii beginning 1900. Sex, race, age, and nativity detail, series A 178–177 and A 180–194, include Alaska and Hawaii beginning 1960.

[7] Ages not reported and ages unknown are not included. Prior to 1850 age detail for white only. Age detail columns have changed for early censuses as follows: 1790: Under 16 years and over 16 years for males only; 1300–1820: Under 10 years, 10–15 years, 16–25 years, 26–44 years, hnd 45 and over; 1830–1860: Under 5 years, 5–14 years, 15–29 years, 30–59 years, 60–79 years, 80 and over. See also footnote 5.

[8] Nativity data for 1850–1980 are based on complete-count data; data for 1940–1970 are sam le data. For the 1850 and 1860 censuses, nativity detail for slaves was not compiled; nativity unknown or not reported is not included.

- Represents zero.
NA Not available.
Z Less than 500.

[1] For 1790-1810, white persons only.

[2] Ages not reported and ages unknown are not included. Prior to 1850, age detail for white only. Age detail columns have changed for early censuses as follows: 1790: Under 16 years and over 16 years, for males only; 1800-1820: Under 10 years, 10-15 years, 16-25 years, 26-44 years, and 45 and over; 1830-1860: Under 5 years, 5-14 years, 15-29 years, 30-59 years, 60-79 years, 80 and over. See also footnote 13.

[3] Urban definition comparable with later data.

[4] Urban definition comparable with earlier data.

[5] Population of those parts of Mississippi Territory now in present State. Population per square mile, sex, race, and age detail for Alabama included with Mississippi.

[6] Census taken October 1, 1939.

[7] Census taken October 1, 1929.

[8] Less than 1/10 of a person.

[9] Includes population of area taken to form part of Arizona Territory in 1863.

[10] Data for Territory of New Mexico which included parts of present States of Arizona and New Mexico, and smaller parts of Colorado and Nevada.

[11] Includes 5,602 persons for whom sex, race, and age detail are not available.

[12] North and South Dakota comprised Dakota Territory. Population per square mile, sex, and age detail for South Dakota included with North Dakota.

[13] Age detail excludes all persons residing in Indian Territory or on Indian reservations.

[14] Population total of those parts of Oregon Territory taken to form part of Washington Territory in 1853 and 1859 excluded from Oregon included under Washington. Population per square mile, sex, race, and age detail for Washington included with Oregon.

[15] Sex, race, and age detail for West Virginia, 1790-1860, included with Virginia.

[16] Includes population of Idaho and parts of Montana and Wyoming.

NA Not available.
[1] Based on 20-percent sample of census returns.
[2] Figures for race of head revised to include Mexicans as white. Mexicans were classified as other races in the 1930 reports.
[3] Total for males includes 18,345 persons of unknown age and total for females, 6,567 of unknown age.
[4] Number of female heads in each age group estimated from data on white and Negro heads with marital status and age reported.

Chapter B

Vital Statistics and Health and Medical Care

Vital Statistics (Series B 1-220)

B 1–220. General note.

Vital statistics, including statistics of births, deaths, marriages, and divorces, are compiled for the country as a whole by the National Center for Health Statistics, successor in recent years to the former National Office of Vital Statistics. Beginning 1900, the collection of these data was the responsibility of the Bureau of the Census. In July 1946, this function was transferred to the Federal Security Agency, which, in 1953, was reconstituted as the Department of Health, Education, and Welfare. The National Center for Health Statistics is a part of the Public Health Service in that Department.

The live-birth, death, and fetal-death statistics prepared by the National Center for Health Statistics are based on copies of vital records received from registration offices of all States, of certain cities, and of the District of Columbia. Marriage and divorce statistics are based on information from two sources: (1) Complete counts of events obtained from all States and the District of Columbia and (2) samples of marriage and divorce certificates obtained from States meeting certain reporting criteria. In the statistical tabulations, *United Stales* refers only to the aggregate of the 50 States and the District of Columbia. Alaska has been included in the United States totals since 1959 and Hawaii since 1960.

The annual report, *Vital Statistics of the United Stales,* presents final figures and an annual life table. A series of national summaries *Vital Statistics—Special Reports* containing data on particular subjects was issued each year from 1934 to 1959. This series was superseded by *Vital and Health Statistics,* Series *20,* 21, and **22.**

Although every State has adopted a law requiring the registration of births, deaths, and fetal deaths, these laws are not uniformly observed. One condition for admission to the national registration areas was a demonstration of registration completeness of at least 90 percent. On the basis of this criterion, all of the States were admitted to both the birth- and death-registration areas by 1933. It is recognized, however, that the methods then used in testing completeness were subject to considerable error.

The annual collection of mortality statistics for the national death-registration area began in 1900 with 10 registration States and the District of Columbia; the collection of birth statistics for the national birth-registration area began in 1915, also with 10 States and the District of Columbia. The changing composition of the two registration areas makes it impossible to obtain geographically comparable birth and death data for the entire United States before 1933. Although the national birth-registration area was not started until 1915, annual estimates of births have been prepared for the period 1909–34. These estimates include adjustments for underregistration and for States not in the birth-registration area before 1933. Beginning 1933, the birth- and death-registration areas have comprised the entire United States, including Alaska beginning 1959 and Hawaii beginning 1960. National statistics on fetal deaths were compiled for 1918 and annually since 1922.

Prior to 1951, birth statistics were the result of a complete count of the records received in the Public Health Service. Since 1951, they have been based on a 50-percent sample of all registered births (except for 1955 when they reverted to a complete count and for 1967 when they were based on a 20–50 percent sample).

Mortality statistics are compiled in accordance with World Health Organization regulations, which specify that member nations classify causes of death according to the *International Statistical Classification of Diseases, Injuries, and Causes of Death.* The current (1973) classification, "Eighth Revision International Classification of Diseases, Adapted for Use in the United States," has been used since 1968.

Growth of Birth- and Death-Registration Area: 1900 to 1933

Year	Conterminous United States, midyear population	Birth-registration area [1]			Death-registration area [1]		
		Midyear population		Number of States	Midyear population		Number of States
		Number	Percent of total		Number	Percent of total

[1] District of Columbia excluded from count of number of States but included in the population figures.

Accurate measures of birth-registration completeness on a nationwide basis were obtained for the first time in 1940, when studies were made in connection with the population census of that year. They showed that, for the United States as a whole, birth registration was 92.5 percent complete. A corresponding study 10 years later indicated that registration had improved considerably, with 97.9 percent of the births in 1950 being recorded. Only in a few States was underregistration shown to be still a problem. The results of this study have been published in considerable detail (Bureau of the Census, *Infarct Enumeration Study,* 1950) and provide a basis for adjusting registered birth data for underreporting and for making estimates of registration completeness in post-censal years. Birth registration has continued to improve since 1930 and, in 1968, 99.1 percent of the live births were registered. (See National Office of Vital Statistics, "Birth-Registration Completeness in the United States and Geographic Areas, 1950," parts I, 11, and III, *Vital Statistics—Special Reports,* vol. 39, Nos. 2 and 4, and vol. 45, No. 9.)

Death registration is believed to be at least as complete as birth registration. However, quantitative information on the completeness with which deaths are reported is limited to that obtained years ago in applying the "90-percent" standard for entry into the death-registration area and to information obtained from occasional local area studies. While underregistration for the country as a whole is negligible, local studies furnish evidence that in certain isolated places underreporting of deaths may still be a problem. Registration of fetal deaths is probably significantly incomplete in all areas.

National collections of statistics on marriages and divorces in the United States were made for various years from 1867 to 1940 and for each year since 1944. Estimates have been made for intervening years and for years in which collections were not complete. A marriage-registration area was established by the Public Health Service in 1957, and a divorce-registration area in 1958. At the beginning of 1971, the marriage-registration area covered 40 States and 3 independent registration areas; the divorce-registration area, 29 States and 1 independent area.

Population statistics published or made available by the Bureau of the Census have been used in computing the vital rates shown here. Rates for 1940, 1950, 1960, and 1970 are based on the population enumerated in the censuses of those years which were taken as of April 1. Rates for all other years are based on midyear (July 1) estimates of population made by the Bureau of the Census.

Except for 1941–1946, vital rates are based on the population residing in conterminous United States. In those years, the transfer overseas of several million men precluded the computation of birth and divorce rates strictly comparable with such rates for prewar years. For 1941–1946, the birth and divorce rates are based on the population including the Armed Forces overseas. (For a discussion of the interpretation of rates during wartime, see "Summary of Natality and Mortality Statistics, United States, 1943," *Vital Statistics—Special Reports,* vol. 21, No. 1, and "Marriage and Divorce in the United States, 1937 to 1545," *Vital Statistics—Special Reports,* vol. 23, No. 9.)

Vital statistics showing color and race are compiled from entries which appear on certificates filed with vital registration offices. The classification "white" includes persons reported as Mexican, Cuban, and Puerto Rican. The Negro group includes persons of mixed Negro and other ancestry. For births, the newborn child is ordinarily assigned to the race of the parents. If parents are of different races, the following applies: (1) When only one parent is white, the child is assigned the other parent's race; (2) when neither is white, the child is assigned the father's race. For additional details, see source.

B 1. Live births, 1909–1970.

Source: U.S. Public Health Service, 1933–1567, *Vital Statistics of the United States, 1967,* vol. II, part A, p. 1–2; 1968–1970, same report, annual issues.

See general note for series B 1–220.

B 3–4. Marriages and divorces, 1920–1970.

Source: U.S. Public Health Service, 1920–1965, *Vital Statistics of the United States, 1965,* vol. III, pp. 1–5 and 2–5; 1966–1970, same report, annual issues.

See general note for series B 1–220.

B 5–10. Birth rate—total and for women 15–44 years old, by race, 1800–1970.

Source: Series B 5, 1820–1900, Henry D. Sheldon, *The Older Population of the United States,* John Wiley and Sons, New York, 1958, p. 145 (copyright). Series B 6 and B 9, 1800–1900, Warren S. Thompson and P. K. Whelpton, *Population Trends in the United States,* McGraw-Hill, New York, 1933, p. 263 (copyright). Series B 5–10, 1909–1968, U.S. Public Health Service, *Vital Statistics of the United States, 1968,* vol. I, p. 1–4; 1969–1970, same report, annual issues.

Estimates for 1909–1934 were prepared by Pascal K. Whelpton. For 1915–1932, the figures include adjustments for States not in the registration area; for years prior to 1915, figures are estimates based on the number of registered births in the 10 original registration States for the same period.

See also general note for series B 1–220.

B 11–19. Fertility rate and birth rate, by age of mother, by race, 1940–1970.

Source: U.S. Public Health Service, 1940–1968, *Vital Statistics of the United States, 1968,* vol. I, p. 1–7; 1969, *Monthly Vital Statistics Report, 1969,* vol. 22, No. 7, p. 5; 1970, *Vital Statistics of the United States, 1970,* vol. I.

Series B 11–19 is an age-adjusted rate because it is based on the assumption that there are the same number of women in each age group. The rate of 2,480 in 1970, for example, means that if a hypothetical group of 1,000 women were to have the same birth rate in each age group observed in the actual childbearing population in 1970, the women would have a total of 2,480 children by the time they reached the end of the reproductive period (taken here as age 50), assuming that all of the women survive to that age.

See also general note for series B 1–220.

B 20–27. Birth rate, by race, by live-birth order, 1940–1970.

Source: U.S. Public Health Service, 1940–1968, see source note for series B 11–19, p. 1–9; 1969, see same source note, p. 6–7; 1970, see same source note.

B 28–35. Illegitimate live births and birth rates, by age and race of mother, 1940–1970.

Source: U.S. Public Health Service, *Vital Statistics of the United States, 1970,* vol. I.

These are estimated data based on certificates of live birth filed for each child born in the United States. During the 1930's almost all States had a query concerning legitimacy or illegitimacy on their certificates. During the 1940's, concern for confidentiality prompted a number of States to remove it. These data are based on reports of 34 States and the District of Columbia for 1940–1965 and on reports of 40 States and the District of Columbia for 1966–1970.

In making estimates of the number of illegitimate births occurring in the country as a whole, the States were grouped into nine geographic divisions. The combined ratio of illegitimate births per 1,000 total live births for all reporting States in a single geographic division was then applied to all live births to residents of that division. This estimating procedure was separately applied for white persons and for Negro and other persons. The sum of these estimates for the nine geographic divisions represents the estimate for the United States. No adjustments were made for misstatements of legitimacy status on the birth record or for failure to register illegitimate births because the extent of such reporting problems is unknown. A birth with legitimacy status not recorded was considered to be legitimate.

The rates shown for the years 1951–65 differ from those published in earlier issues of *Vital Statistics of the United States.* The rates shown here are based on a smoothed series of population estimates for unmarried women by race and age which were not available when

the rates previously published were computed. For details concerning these estimates and other data for illegitimate births, see U.S. Public Health Service, National Center for Health Statistics, "Trends in Illegitimacy, United States, 1940–1965," *Vital and Health Statistics*, PHS Pub. No. 1000-Series 21-No. 15, February 1968.

B 36–41. **Gross** and net reproduction rates, by race, 1905–10 to 1970.

Source: U.S. Bureau of the Census, 1905–10 to 1935–40, Sixteenth Census Reports, *Differential Fertility, 1940 and 1910—Standardized Fertility Rates and Reproduction Rates;* **U.S.** Public Health Service, 1935, *Vital Statistics of the United States, 1950,* vol. I, p. 87; 1940–1956, *Vital Statistics of the United States, 1956,* vol. I, p. lxxix; 1957–70, same report, annual issues.

The gross reproduction rate represents the number of daughters a hypothetical cohort of 1,000 women entering the child-bearing period would have during their lives, if they were subject to the age-specific birth rates observed in a given time period, and if none of the cohort were to die before the child-bearing period was completed. Age-specific birth rate is the ratio of births by age of mother to women in each age interval for a specified year. The gross reproduction rate is the sum of the age-specific birth rates of female infants per 1,000 women. It shows the maximum possible replacement of women that might be expected from the given set of age-specific birth rates. If no migration took place and if the gross rate remained below 1,000, no improvement in mortality alone could prevent the population from declining when a stable age distribution had been reached.

The net reproduction rate is based on the specific fertility and mortality conditions existing in a given time period. If the age-specific birth and death rates of a certain year (or years) were to continue until the population became stable, a net reproduction rate of 1,000 would mean that a cohort of 1,000 newly born girls would bear just enough daughters to replace themselves.

Reproduction rates are useful in the analyses of fertility and mortality conditions of a given period, but they are not indicators of future population growth. They do not take into account such factors as nuptiality, marital duration, and size of family, and they assume the continuation of the age-specific rates in a given year throughout the lifetime of a cohort of women. Since the United States has experienced major changes in marriage and fertility rates over short periods of time, variations in reproduction rates should not be taken as indications of long-run movements in family formation and rates of fertility and mortality.

B 42–48. Percent distribution **of** ever-married women **(survivors of** birth cohorts **of** 1835–39 to **1920–24),** by race and by number **of** children ever born, as reported in censuses **of** 1910, 1940, 1950, 1960, and 1970.

Source: 1910–1950, all races, Conrad and Irene Taeuber, *The Changing Population of the United States, 1790–1955,* John Wiley and Sons, New York, 1957, pp. 255–256 (copyright). By race, **U.S.** Bureau of the Census, 1910 and 1940, Sixteenth Census Reports, *Population, Differential Fertility, 1940 and 1910,* part 2; 1950, U.S. *Census of Population: 1950,* Special Reports, P-E, No. 5C, *Fertility.* 1960 and *1970, U.S. Census of Population: 1960* and *1970,* PC(2)3A, *Women by Number of Children Ever Born.*

These data are based on an analysis of the decennial censuses. In each of these censuses women who had ever married were asked about the number of children they had ever borne. When these women are classified according to age, it is possible to suggest the trend in fertility among women who had completed their childbearing at each census.

Caution should be used in comparing the data from the 1910 census with those from later censuses. The 1910 census may have inadvertently obtained some stillbirths in the counts of children ever born, resulting in overstatements of fertility. Comparisons of the average number of children ever born to women age 40–44 in 1910 with the average for those surviving to age 70–74 in 1940 show about ten percent more children at the earlier date. In contrast, there is little difference when the average numbers of children ever born are compared for women of recently completed fertility in 1940 with the average for survivors at much older ages in the censuses of 1950 to 1970, suggesting that the memory factor does not cause much undercount of children by women long past the childbearing ages.

Illegitimate births are represented in the data insofar as the wonnen ever married included births before marriage (as they were supposed to do) in their reported total number of children ever born. Comparisons of cumulations of birth data from annual vital statistics (that include all illegitimate births) with recent census data on children ever born suggest that the census data may be short by about 5 percent for all races and about 3 percent for whites.

B 49–66. Children ever born to women ever married, by race and age **of** women, 1910–1970.

Source: U.S. Bureau of the Census. 1910 and 1940, Sixteenth Census of Population, Special Reports, *Differential Fertility, 1940 and 1910—Fertility for States and Large Cities,* tables 3 and 4; *Differential Fertility, 1940 and 1910—Women by Number of Children Ever Born,* tables 9 and 12; and unpublished data. 1950, *U.S. Census of Population: 1950,* Special Report P-E No. 5C, *Fertility,* tables 1, 2, and 12; and unpublished data. 1960, *U.S. Census of Population: 1960,* vol. I, *Characteristics of the Population,* part 1, *U.S. Summary,* table 190, and Final Report PC(2)-3A, *Women by Number of Children Ever Born,* tables 2 and 8. 1970, *U.S. Census of Population: 1970,* part 1, *U.S. Summary,* table 213.

These data are based on an 8.9 percent sample for 1910, 3.3 percent for 1940, 2.4 percent for 1950, 25 percent for 1960 (except that the separate data for Negroes are from a 5 percent sample), and 20 percent for 1970. The data shown for 1940 in series B 42–48 and series B 49–66 include special adjustments to allow for the fertility of women with no original report on number of children ever born and therefore differ slightly from the data published in the reports on *Differential Fertility, 1940 and 1910.*

See the text for series B 42–48 for cautions regarding the comparability of data from the 1910 census with data from later censuses, and possible minor shortages in counts of children ever born due to underreporting of illegitimate births.

B 67–98. Number **of** children under **5** years old per 1,000 women 20 to 44 years old, by race and residence, by geographic divisions, 1800–1970.

Source: Series B 67–68, 1800–1940, and series B 69–98, 1800–1840 and 1910–1950, Wilson H. Grabill, Clyde V. Kiser, and Pascal K. Whelpton, *The Fertility of American Women,* John Wiley and Sons, New York, 1958 (copyright). Series B 67–68, 1950–1970 and series B 69–98, 1850–1900 and 1960–1970, U.S. Bureau of the Census, special computations from decennial census reports.

Figures for series B 67–68 were adjusted for underreporting of children in 1800–1940 on the basis of factors obtained for 1925–1930 and for underreporting of both women and children in 1950–1970 on the basis of estimates derived by analytical methods. The ratios have been standardized for age of women (except for white women for 1800–1820) using the 1930 age distribution of women to offset the effect of changes in the age distribution of the female population. Therefore, the figures represent the fertility ratios of women having the same age distribution as those in 1930. Rates for 1800–1860 are partly estimated.

For composition of geographic divisions, see text for series A 172–194. The urban-rural classification shown for 1800–1950 is based on the rules used in 1940. That shown for 1960–1970 is based on the rules used for those censuses. For definition of residence by old and new rules of classification, see text for series A 43–56. The change

in rules is known to have relatively little effect on the fertility ratios for 1960 and probably has little effect on the comparability of the fertility ratios for 1960–1970 with those of earlier years.

B 99-106. Median interval between births, by race, **1930-1969.**

Source: U.S. Bureau of the Census, *Current Population Reports,* series P-20, Nos. 180 and 186, and unpublished data.

The median interval between two sets of events is an estimate of the length of time after the first set of events in which half of the second set takes place. If the first set of events is births of a first child and the second set is births of a second child and the estimate of the median interval is 32.2 months, the interpretation is that half of the second births occur within 32.2 months of the first births.

Data on median intervals between births and first marriage and between births of successive orders are useful for comparing child-spacing and family building patterns between subgroups within a population at a given point in time and between different cohorts either of women or (as in series B 67–98) of their children.

B 107-115. Expectation of life at birth, by race and sex, **1900-1970.**

Source: U.S. Public Health Service, 1900–1967, *Vital Statistics of the United Stales, 1967,* vol. **11,** part A, p. 5–8; 1968–1970, same report, annual issues.

Derivation of estimates is described in "Estimated Average Length of Life in the Death-Registration States," *Vital Statistics — Special Reports,* vol. 33, No. 9.

The expectation of life at birth is the average number of years that members of a hypothetical cohort would live if they were subject throughout their lives to the age-specific mortality rates observed at the time of their birth. This is the most usual measure of the comparative longevity of different populations. There is some objection to the use of the average duration of life as a standard of comparison because the method of calculating it gives great weight to the relatively large number of deaths occurring in the first year of life. This influence may be entirely eliminated by considering instead the average lifetime remaining to those members of the cohort surviving to age **1,** or, in other words, the expectation of life at age **1.** However, this objection is growing less valid as infant mortality decreases.

B 116-125. Expectation of life at specified ages, by sex and race, **1900-1970.**

Source: 1901–1910, white population, U.S. Bureau of the Census, *United States Life Tables, 1900–1981,* pp. 40–47. 1900–1902 and 1909–11 to 1956, U.S. Public Health Service, *Vital Statistics of the United States, 1956,* vol. **I,** p. xciii; 1957–1970, same report, annual issues, vol. **I,** 1957–1959, and vol. **11,** thereafter.

The expectation of life at a specified age is the average number of years that members of a hypothetical cohort would continue to live if they were subject throughout the remainder of their lives to the mortality rates for specified age groups observed in a given time period.

B 126-135. Expectation of life at specified ages, by sex, for Massachusetts, **1850** to **1949-51.**

Source: 1850, Metropolitan Life Insurance Company, *Statistical Bulletin,* vol. 9, No. 3, March 1928, pp. 7–8; 1855, Edgar Sydenstricker, *Health and Environment,* McGraw-Hill, New York, 1933, p. 164 (copyright): 1878–82 to 193941, Louis I. Dublin, Alfred J. Lotka, and Mortimer Spiegelman, *Length of Life,* Ronald Press, New York, 1949 pp. 326 and 334 (copyright); 1949–51, U.S. Bureau of the Census and U.S. Public Health Service, *Vital Statistics — Special Reports,* vol. 41, Supplement 20, March 21, 1956, pp. 193 and 195.

See text for series B 116–125.

B 136–138. Fetal death ratio, by race, **1922–1970.**

Source: U.S. Public Health Service, 1922–1944, *Vital Statistics of the United Stales, 1956,* vol. **I, p.** lxxxviii; 1945–1967, same report, *1967,* vol. II, part A, p. 3–4; 1968–1970, same report, annual issues.

Lack of uniformity in requirements for registration and variation in completeness of registration influence the comparability of the data over the years, especially in the series based on all reported fetal deaths. Considering the probable total effect of these factors, as well as that of incompleteness of the registration area until 1933, it appears likely that the ratios understate any decline in fetal mortality. Changes in the regulations have more often been in the direction of broadening the base of fetal death reporting, than in the other direction. With respect to completeness of reporting, the situation has probably improved because of the increases in the number of women receiving hospital and medical care at childbirth and also because of the general strengthening of the vital registration system.

B 139-141. Neonatal mortality rate, by race, **1915-1970.**

Source: U.S. Public Health Service, 1915–1929, *Vital Statistics of the United States, 1950,* vol. **I,** pp. 258–259; 1930–1939, *Vital Statistics — Special Reports,* vol. 45, No. **1,** pp. 8–10; 1940–1967, *Vital Statistics of the United States, 1967,* vol. **11,** part **A,** p. 2–3; 1968–1970, same report, annual issues.

The neonatal mortality rate represents the number of deaths of infants under 28 days (exclusive of fetal deaths) per 1,000 live births.

B **142-144.** Infant mortality rate, by race, **1915-1970.**

Source: **U.S.** Public Health Service, 1915–1939, *Vital Statistics — Special Reports,* vol. 45, No. **1,** p. 7; 1940–1970, see source for series B **139–141.**

The infant mortality rate represents the number of deaths under **1** year (exclusive of fetal deaths) per **1,000** live births. The rates have been computed by the conventional method in which the infant deaths occurring in a specified period are related to the number of live births occurring during the same period. Rates computed in this way are influenced by changes in the number of births and will not be comparable if the birth rate is fluctuating widely. Deaths under **1** year of age occurring during any calendar year are deaths not only of infants born during that year but also of infants born during parts of the previous year. An approximate correction of this error can be made by relating infant deaths during a specified year to the year in which those infants were born. See Bureau of the Census, "Effect of Changing Birth Rates Upon Infant Mortality Rates," *Vital Statistics — Special Reports,* vol. 19, No. 21.

B 145-147. Maternal mortality rate, by race, **1915–1970.**

Source: U.S. Public Health Service, 1915–1939, *Vital Statistics — Special Reports,* vol. 46, No. 17, p. 438; 1940–1967, *Vital Statistics of the United States, 1967,* vol. **11,** part **A,** p. 1–41; 1968–1970, same report, annual issues.

The maternal mortality rate represents the number of deaths from deliveries and complications of pregnancy, childbirth, and the puerperium per 10,000 live births.

B 148. Infant mortality rate, **for** Massachusetts, **1851-1970.**

Source: 1851–1899, *77th Annual Report* of *Vital Statistics* of *Massachusetts,* p. 132; 1900–1956, U.S. Bureau of the Census and US. to 1954 and vol. 11, part A, thereafter), various annual issues. Series B 151, 1900–1920, *Vital Statistics of the United States, 1950,* vol. I, p. 218; 1921–1940, *Vital Statistics Rates in the United States, 1900–1940,* p. 266; 1941–1970, unpublished data. Series B 164–165, U.S. Bureau of the Census, 1900–1933, *Mortality Statistics,* various annual issues; 1934–1938, *Vital Statistics of the United States, Special Reports, Deaths From Each Cause, United States: 1934–1938;* 1939–1949, *Vital Statistics of the United States,* part I; 1950–1970, *Vital Statistics of the United States,* vol. II, part A, various annual issues.

Mortality data are classified according to the numbers and titles of the detailed International List of Causes of Death. A large proportion of the death certificates filed annually in the United States report two or more diseases or conditions as joint causes of death. General statistical practice requires that cases involving more than one cause of death be changed to a single cause.

In the French edition of the International List (1900), certain principles for determining the single cause to be selected from the joint causes given were incorporated as a part of the general classification scheme, As an outgrowth of practices in this country after 1902, definite relationships among the various conditions represented by items in the International List were put in concrete form in the *Manual of Joint Causes of Death,* first published in 1914, and revised to conform with successive revisions of the International List. This manual, which was developed for use in the United States, was followed until 1949, when an international procedure for joint-cause selection was adopted. The new international rules place the responsibility on the medical practitioner to indicate the underlying cause of death. This change, in conjunction with the Sixth Revision of the International List in 1949, the Seventh Revision in 1958, and the Eighth Revision in 1968, has introduced rather serious breaks in statistical continuity.

Time-trend studies of causes of death would be facilitated if the International List were maintained without change over a long period of years. However, if the list were rigidly fixed it would be inconsistent with current medical knowledge and terminology. To obtain the advantages of frequent revision, and yet to retain a fixed list for a number of years, revisions are made at an international conference every 10 years. In the process of revision, discontinuities are introduced into the time trends of death rates for certain specific causes of death (see National Office of Vital Statistics, "The Effect of the Sixth Revision of the International List of Diseases and Causes of Death Upon Comparability of Mortality Trends," *Vital Statistics—Special Reports,* vol. 36, No. 10).

Improvement in diagnostic procedures and development of medical knowledge and facilities are other important factors in the study of changes in death rates for certain causes.

B 167–173. Death rate, by race and sex, **1900–1970.**

Source: 1900–1968, U.S. Public Health Service, *Vital Statistics of the United States, 1968,* vol. II, part A; 1969–1970, unpublished data.

B 174–180. Age-adjusted death rate, by race and sex, **1900–1970.**

Source: See source for series B 167–173.

The age-adjusted death rate is a convenient summary index that "corrects" for differences in age composition. These rates were computed by taking the age-distribution of the population in 1940 as the "standard" without regard to sex, color, or other characteristics. The age-specific death rates actually observed in a given year were applied to the age distribution of this standard population and a total death rate was computed. The age-specific death rate is the rate of deaths per 1,000 population in each age interval for a specified year. For a detailed description of the direct method by which these rates were computed, see *Vital Statistics Rates in the United States, 1900–1940,* pp. 66–69.

See also: U.S. Commissioner of Labor, *A Report on Marriage and Divorce in the United States, 1867 to 1886;* U.S. Bureau of the Census, *Marriage and Divorce, 1867–1906; Vital Statistics—Special Reports,* vol. 9, No. 60, "A Review of Marriage and Divorce Statistics: United States: 1887–1937"; *Marriage and Divorce, 1916* and annual issues for 1922–1932; S. A. Stauffer and L. M. Spencer, "Recent Increases in Marriage and Divorce," *American Journal of Sociology,* vol. 44, No. 4 (for 1933–1936); U.S. Bureau of the Census, *Vital Statistics—Special Reports,* vol. 15, Nos. 13 and 18, "Estimated Number of Marriages by State: United States, 1937–1940" and "Estimated Number of Divorces by State: United States, 1937–1940," respectively. For exact population base figures, see *Vital Statistics—Special Reports,* vol. 46, No. 12, p. 330.

Marriage and divorce records are filed only at the county level in some States, but gradually the various States are requiring by law that such events be recorded at the State level. The completeness of reporting to the State offices varies, but there has been no nationwide test. A marriage-registration area covering 30 States and 5 independent areas was established by the National Office of Vital Statistics in 1957. A major criterion for admission of a State to the registration areas was agreement with the National Office of Vital Statistics to conduct a test of marriage registration completeiiess. By 1971, the marriage-registration area covered 40 States arid 3 independent areas. A divorce-registration area with 14 States and 3 independent areas was inaugurated in 1958. By 1971, it covered 29 States and 1 independent area.

The marriage and divorce rates shown in series B 215 and B 217 are based on those segments of the female population that may be considered as subject to possible marriage and divorce.

Series B 1–4. Live Births, Deaths, Marriages, and Divorces: 1909 to 1970

[In thousands. Birth, marriage, and divorce figures represent estimates of all such events; death figures, the number of registered events]

*Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Computed by relating total births, regardless of age of mother, to women aged 15–44 years.
[2] Based on 20- to 50-percent sample of births.
[3] Figures by race exclude New Jersey: State did not require reporting of race.
[4] Includes Alaska.

Series B 11-19. Fertility Rate and Birth Rate, by Age of Mother, by Race: 1940 to 1970

[Total fertility rates are the sums of birth rates, by age of mother, multiplied by 5. Birth rates are live births per 1,000 women in specified group. Prior to 1959, births adjusted for underregistration; thereafter, registered live births. Based on 50-percent sample of births for 1951–1954, 1956–1966, and 1968–1970; on 20- to 50-percent sample for 1967]

Year and race	Total fertility rate	Birth rate, by age of mother

Series B 20–27. Birth Rate, by Race, by Live-Birth Order: 1940 to 1970

[Rates are live births per 1,000 women aged 15–44 years in specified race group. Live-birth order refers to number of children born alive to mother. Prior to 1959, births adjusted for underregistration; thereafter, registered live births. Figures for not stated birth order have been distributed. Based on 50-percent sample of births for 1951–1954, 1956–1966, and 1968–1970; on 20- to 50-percent sample for 1967]

*Denotes first year for which figures include Alaska and Hawaii.
[1] Rates computed by relating total illegitimate births regardless of age of mother to women aged 15–44 years.
[2] Rates for total computed by relating illegitimate births to mothers aged 40 and over to unmarried women aged 40–44 years. Rates for race detail computed by relating births to mothers aged 35 and over to women aged 35–44 years.
[3] Includes Alaska.
[4] Excludes New Jersey; State did not require reporting of race.

Series B 36–41. Gross and Net Reproduction Rates, by Race: 1905–10 to 1970

[Based on 50-percent sample of estimated total live births for 1951–1954, 1956–1966, and 1968–1970; on 20- to 50-percent sample for 1967]

* Denotes first year for which figures include Alaska and Hawaii.

[1] For 1945–1970, includes only deaths for which the period of gestation was given as 20 weeks or more or not stated. For earlier years, includes all fetal deaths, regardless of gestation. In 1945 ratios based on all fetal deaths, regardless of gestation, were: Total, 26.6; white, 24.1; Negro and other, 44.6.

[2] Figures by race exclude New Jersey; State did not require reporting of race.

[3] Includes Alaska.

[4] Mexicans included with Negro and other.

Series B 148. Infant Mortality Rate, for Massachusetts: 1851 to 1970

[Deaths under 1 year per 1,000 live births. Excludes fetal deaths. Data for 1940 to 1968 are by place of residence; for other years, by place of occurrence]

Year	Rate	Year or period	Rate	Period	Rate	Period	Rate
	148		148		148		148
1970	16.8	1961	21.6	1940–44	34.3	1895–99	153.2
1969	18.3	1960	21.6	1935–39	43.2	1890–94	163.2
1968	19.9	1959	22.3	1930–34	53.9	1885–89	158.5
1967	20.0	1958	22.8	1925–29	67.6	1880–84	161.3
1966	21.2	1957	22.7	1920–24	78.7	1875–79	156.8
1965	22.2	1956	22.4	1915–19	100.2	1870–74	170.3
1964 [1]	19.8	1955	21.9	1910–14	116.7	1865–69	146.3
1963	20.6	1950–54	22.8	1905–09	134.3	1860–64	142.5
1962	21.8	1945–49	28.4	1900–04	141.4	1855–59	122.9
						1851–54	131.1

[1] Excludes approximately 6,000 deaths registered in Massachusetts, primarily to residents of the State, covering all ages.

Series B 149–166. Death Rate, for Selected Causes: 1900 to 1970

[Number of deaths, excluding fetal deaths, per 100,000 population. Prior to 1933, for death-registration area only; see general note for series B 1–220]

Year	Tuberculosis all forms	Syphilis and its sequelae [1]	Typhoid and paratyphoid fever	Scarlet fever and streptococcal sore throat	Hepatitis	Diphtheria	Whooping cough	Measles	Malignant neoplasm	Diabetes mellitus	Major cardiovascular diseases	Influenza and pneumonia	Gastritis, duodenitis, enteritis, and colitis	Cirrhosis of liver	Motor vehicle accidents	Accidents, falls	All other accidents	Suicide

* Denotes first year for which figures include Alaska and Hawaii.
Z Less than 0.05.
[1] 1900–1920, excludes aneurysm of the aorta.
[2] Includes neoplasms of lymphatic and hematopoietic tissues.
[3] All years, excludes pneumonia of newborn; 1900–1920, excludes capillary bronchitis.
[4] All years, excludes diarrhea of newborn; 1900–1920, includes ulcer of duodenum.
[5] 1906–1925, excludes automobile collisions with trains and streetcars, and motorcycle accidents.
motor vehicle accidents.
[7] Includes Alaska.

Series B 167–180. Death Rate, by Race and Sex: 1900 to 1970

[Number of deaths, excluding fetal deaths, per 1,000 population. Prior to 1933 for death-registration area only; see general note for series B 1-220]

Year	Death rate							Age-adjusted death rate						
	Total	White			Negro and other			Total	White			Negro and other

* Denotes first year for which figures include Alaska and Hawaii.
[1] Excludes New Jersey; State did not require reporting of race.
[2] Includes Alaska.

Series B 181–192. Death Rate, by Age and Sex: 1900 to 1970

[Number of deaths, excluding fetal deaths, per 1,000 population for specified group. Prior to 1933, for death-registration area only; see general note for series B 1-220]

Year	Total [1]	Under 1 year	1–4 years	5–14 years	15–24 years	25–34 years	35–44 years	45–54 years	55–64 years	65–74 years	75–84 years	85 years and over

* Denotes first year for which figures include Alaska and Hawaii.

[1] Age not reported included in "Total," but not distributed among specified age groups.

[2] Based on enumerated population adjusted for age bias in the population for Negro and other races, 55 to 69 years old.

Series B 193–200. Death Rate, by Sex and by Selected Cause, for Massachusetts: 1860 to 1970

[Includes only deaths, excluding fetal deaths, occurring within Massachusetts, except for 1940–1970; for these years, data are for deaths occurring to residents of Massachusetts[1]

* Denotes first year for which figures include Alaska and Hawaii.
[1] 15 years old and over. Population enumerated as of April 1 for 1940, 1950, and 1960, and estimated as of July 1 for all other years; includes Armed Forces abroad for 1941–1946.
[2] Persons 14 years old and over.
[3] Includes Alaska.

Chapter B

Health and Medical Care (Series B 221-459)

B 221–235. Total and per capita national health expenditures, by type of service, **1929–1970.**

Source: U.S. Social Security Administration. 1929–1968, *Compendium of National Health Expenditures Data,* DHEW Pub. No. (SSA)73-11903, table 6; 1969–1970, *National Health Expenditures, Calendar Years 1929–71,* Research and Statistics Note, No. 3, 1973, DHEW Pub. No. (SSA)73-11701, tables 2 and 8.

The generai method of estimating national health expenditures is to estimate the total outlays for each type of medical service or expenditure and to deduct the amounts paid to public and private hospitals, physicians in private practice, etc., under each public program. The figures for each public program are allocated by type of expenditure on the basis of published and unpublished reports for each program.

B 223, hospital care. The estimates of expenditures for hospital care are based on the data on hospital finances published by the American Hospitai Association, and increased slightly to allow for nonreporting and for osteopathic hospitals. Salaries of physicians and dentists on the staffs of hospitals and hospital outpatient facilities are considered a component of hospital care and are, therefore, included. Expenditures for the education and training of physicians and other health personnel are included only where they are not separable from the cost of hospital operations.

B 224–226, physicians' services, dentists' services, and other professional services. The estimates of expenditures for the services of physicians, dentists, and other health professions in private practice are based on the gross incomes from self-employment practice reported to the Internal Revenue Service on Schedule C of the income-tax return (as shown in *Statistics of Income,* published by the Internal Revenue Service). Data are totaled for practitioners in sole proprietorships and partnerships. The total also includes the estimated gross income of offices that are organized as corporations, the gross receipts of medical and dental laboratories estimated to represent patient payments to medical laboratories, and the estimated expenses of group-practice prepayment plans in providing physicians' services (to the extent that these are not included in physicians' income from self-employment). Estimated receipts of physicians for making life insurance examinations are deducted.

Salaries of physicians and dentists on the staffs of hospitals and hospital outpatient facilities are considered a component of hospital care (series B 223).

Salaries of visiting nurse associations, estimated from surveys conducted by the National League for Nursing, are added to the private income of other health professionals. Deductions and exclusions are made in the same manner as for expenditures for physicians' and dentists' services.

B 227–228, drugs and drug sundries, and eyeglasses and appliances. The basic source of the estimates for these items is the report of Personal consumption expenditures in the Department of Commerce national income accounts in the monthly *Survey of Current Business.* Total expenditures for drugs and appliances are the sum of the Department of Commerce estimates and the expenditures under all public programs for these products.

B 229, nursing-home care. Expenditures for nursing-home care are derived by applying an estimated cost per patient day to the total days of care. Total days of care are estimated by applying an average occupancy rate, as reported by the Federal Housing Administration, to the number of nursing-home beds, as reported by the Division of Hospital and Medical Facilities of the Public Heslth Service in their annual report, *Hill-Burton State Plan Data.*

The cost per patient day was based on unpublished data from a survey of nursing homes financed by the Social Security Administration.

B 230, expenses for prepayment and administration. Prepayment expenses represent the difference between the earned premiums or subscription charges of health insurance organizations and their claim or benefit expenditures (expenditures in providing such services in the case of organizations that directly provide services). In other words, it is the amount retained by health insurance organizations for operating expenses, additions to reserves, and profits, and is considered a consumer expenditure. The data on the financial experience of health insurance organizations are reported annually in a *Social Security Bulletin* article on private health insurance.

The administration component represents the administrative expenses (where they are reported) of federally financed health programs.

B 231, government public health activities. The Federal portion consists of outlays for the organization and delivery of health services and prevention and control of health problems by the Health Services and Mental Health Administration, the National Institutes of Health, and the Environmental Health Service of the Public Health Service. Also included are outlays by other Federal agencies for similar health activities. The data for these programs are taken from Office of Management and Budget, *Special Analyses, Budget of the United States.*

The State and local portion represents expenditures of all State and local health departments and intergovernmental payments to the States and localities for public health activities. It excludes expenditures by other State and local government departments for air-pollution and water-pollution control, sanitation, water supplies, and sewage treatment. The source of these data is *Government Finances,* published annually by the Bureau of the Census.

B 232, other health services. This series covers items of expenditures not elsewhere classified. It includes, for each public program, the residual amount of expenditures not classified as a specific type of medical service. In addition, it includes the following programs: (1) Industrial in-plant services and activities of private voluntary health agencies in the private sector and (2) school health services and nonhospital Federal medical activities in the public sector.

B 233–235, research and medical-facilities construction. Expenditures for medical research, series B 234, include all such spending by agencies whose primary object is the advancement of human health. Also included are those research expenditures directly related to health that are made by other agencies, such as those of the Department of Defense or the National Aeronautics and Space Administration. Research expenditures of drug and medical supply companies are excluded since they are included in the cost of the product. The Federal amouats represent those reported as medical research in the Office of Management and Budget, *Special Analyses, Budget of the United States.* The amounts shown for State and local governments and private expenditures are based on published estimates that have been prepared by the Resources Analysis Branch of the National Institutes of Health, primarily in the periodic publication, *Basic Data Relating to the National Institutes of Health.*

Expenditures for construction, series B **235,** represent "value put in place" for hospitals, nursing homes, medical clinics, and medical-research facilities but not for private office buildings providing office space for private practitioners. Excluded are amounts spent for construction of water-treatment or sewage-treatment plants and Federal grants for these purposes,

The data for value put in place for construction of publicly and privately owned medical facilities in each year are taken from the Department of Commerce monthly report, *Construction Review.*

B 236–247. National and personal health care expenditures, by source of funds, **1929–1970.**

Source: See sources for series B 221–235 (tables 3, 4, and 6 in first source; tables 2 and 5 in second).

For the general method of estimating national health expenditures, see text for series B 221–235. For the dollar amounts of gross national product used as the bases for series B 237, see series F 1.

For the most part, private expenditures represent direct payments made by private consumers and insurance benefits paid in their behalf by private insurers. In addition, they include private philanthropy; amounts spent by industry for maintenance of in-plant health services; expenditures made from capital funds for expansion, renovation, or new construction of medical facilities; and outlays for research by private foundations.

Public funds come from Federal, State, and local governments.

Personal health care expenditures include all such expenditures except research, construction, expenses for prepayment and administration, government public health activities, and expenses of private voluntary agencies for fund-raising and general-health activities.

B 248–261. National health expenditures, by type of expenditure, **1929–1970.**

Source: See sources for series B 221–235 (tables 6 and 10 in first source; tables 2 and 3 in second).

For the general method of estimating national health expenditures, see text for series B 221–235. For the dollar amounts of grossnational product used as the bases for series B 249, see series F 1.

See also text for series B 236–247.

B 253, veterans' hospital and medical care. All veterans with service-connected disabilities are eligible for a wide range of hospital and medical services, as are veterans with nonservice-connected disabilities who are unable to pay for care. The medical care program includes inpatient and outpatient hospital and clinic care, nursing bed care (and a community nursing-home program where nursing bed facilities are not available), day-care centers for psychiatric patients, outpatient dental care, and the provision of prosthetic appliances.

There were 165 Veterans Administration hospitals which collectively in 1970 had a capacity of about 100,000 beds. Medical care is also given to veterans in other Federal hospitals, in hospitals attached to VA domiciliaries, and in State and local government and private hospitals at the expense of the Veterans Administration.

All veterans' health and medical benefit data are provided by the Veterans Administration together with administrative costs. See also series Y 993–994 and Y 1010–1027.

B 254, general hospital and medical care. The Federal Government has directly provided hospital and medical care for specified groups of beneficiaries since 1798 when President John Adams signed into law "An Act for the relief of sick and disabled seamen." Since that time, federally sponsored and financed medical care for specified beneficiaries has been expanded to include Indians, Alaskan natives, lepers, narcotic addicts, commissioned officers of the Public Health Service and their dependents, personnel of the Coast Guard and the former Coast and Geodetic Survey (now part of the National Oceanic and Atmospheric Administration) and their dependents, and owners of commercial fishing boats. The Federal Government also provides medical care in Federal prisons, in-plant health services for Federal employees, medical care for certain Foreign Service employees overseas, medical care in the Ryukyu Islands (returned to Japan in 1972), the Trust Territories, American Samoa, and the Canal Zone, and support for certain medical institutions in the District of Columbia.

Federal outlays include operation of hospitals and medical care units other than military and veterans' facilities and reimbursements to public and private hospitals for the care of Federal civilian beneficiaries. Excluded where separately identifiable are training grants and fellowships and expenditures for research and the construction of medical facilities.

The main source of these Federal civilian expenditures data is the Office of Management and Budget, *The Budget of the United States Government* and its *Appendix* and *Special Analyses.*

State, local, and county governments also provide hospital and medical care for their residents. They own and operate long- and short-term general, psychiatric, and tuberculosis hospitals and also pay to or for the support of a few nongovernment facilities. Expenditures for psychiatric and tuberculosis care, traditionally considered a government responsibility, represent the largest portion of all State and local expenditures for hospital and medical care.

Data shown for series B 254 represent net expenditures for services. State and local vendor payments for specific programs covered in other series, as well as capital outlays and patient revenues, have been excluded. State and local gross totals, as well as figures on capital outlays and patient revenues are shown annually in Bureau of the Census, *Governmental Finances.*

B *255,* public assistance. Public assistance programs existed prior to most of the social insurance programs. They comprise old-age assistance, medical assistance for the aged, aid to the blind, aid to families with dependent children, aid to the permanently and totally disabled, medical assistance, and State and locally financed general assistance programs. See also text for series H 346–367.

Health expenditures for public assistance include money payments to needy recipients, assistance in kind, and vendor payments on behalf of recipients for medical care and for other goods and services (payments directly to the suppliers of service) made from Federal, State, and local funds for the categorical assistance programs and from State and local funds for the general assistance programs. Administrative expenditures under the public assistance programs are included, along with grants for demonstration projects under section 1115 of the Social Security Act.

Beginning in 1966 the Medicaid program, enacted as Title XIX of the Social Security Act in 1965, enabled the States to provide a single health program for the indigent and medically indigent, with Federal financial participation. Benefit standards required that a participating State must provide a minimum of five basic services to all Medicaid recipients (inpatient hospital care, out-patient hospital services, other laboratory and X-ray services, skilled nursing-home services for individuals aged 21 or older, and physicians' services). In addition, States may offer other services—such as drugs and dental care—for which they receive Federal matching funds. Wide variation exists among the individual State programs in terms of eligibility, and scope and duration of benefits.

Many States, with and without Medicaid programs, contribute additional vendor medical payments out of State and local funds under the category of general assistance.

Vendor payments for medical care under public assistance programs are published annually by the National Center for Social Statistics in *Source of Funds Expended for Public Assistance Payments* (report F–1).

B 256, workmen's compensation. Workmen's compensation legislation, designed to provide cash benefits and medical care when a worker is injured on the job and an income to his survivors if he is killed, was the first form of social insurance to develop widely in the United States. The Federal Government led the way covering its civilian employees with an act in 1908, reenacted in 1916. Similar laws were enacted by 10 States in 1911; by the beginning of 1929, all but five States had such laws and, by 1948, all States had them. See also text for series H 332–345.

Each of the States operates its own workmen's compensation program, independent of any Federal legislative or administrative responsibility. As a result, there are wide differences among States

in the scope of employments covered, the amount and duration of benefits paid, and the methods used to insure that compensation will be paid when due.

Workmen's compensation expenditures include: **(1)** Periodic cash payments to the worker during periods of disability and (in some States) to his dependents; **(2)** death and funeral benefits to the worker's survivors; **(3)** lump-sum settlements; **(4)** medical and rehabilitative services; and **(5)** the administrative costs incurred by government bodies in operating or supervising the programs.

Workmen's compensation medical benefits include those for medical and rehabilitative services. Specific medical benefits are included in the law of each State; they are provided without limit as to time and amount in about four-fifths of the States.

Medical benefit payments include the estimated amounts paid out by private insurance carriers, by State insurance funds, and by employers as self-insurers. Also included are the amounts paid under the Federal workmen's compensation programs such as the Federal Employees' Compensation Act, Longshoremen's and Harbor Workers' Compensation Act, War Hazards Compensation Act, and the Defense Bases Compensation Act. Data for periods prior to **1959** exclude expenditures under the laws in Alaska and Hawaii.

Workmen's compensation medical benefit data are estimated annually by the Social Security Administration, using data primarily compiled by the National Council on Compensation Insurance. The data are published regularly in the *Social Security Bulletin* (for recent years, in January issues).

See also text for series H **332–345.**

B 257, Defense Department hospital and medical care. Hospital and medical care for military personnel have been a Federal responsibility since the 18th century, Active-duty personnel have been provided with complete medical care incident to other necessities of life—food, shelter, and clothing. The armed services provide preventive treatment, curative and rehabilitative services in military hospitals, outpatient clinics, dispensaries, and field and shipboard stations. In **1965** there were **187** hospitals owned and operated by the armed services—51 Army hospitals, 37 Navy hospitals and **99** Air Force hospitals—with a total complement of **36,066** beds.

Figures for series B **257** include the expenses of operating military hospitals, clinics and other medical facilities, the salaries of military medical personnel, payments for medical care in nonmilitary facilities and expenditures for the dependents' medical care program.

B 258, school, maternal, and child health services. School health programs of educational agencies are programs financed and administered by State and local departments of education. These programs include medical and dental screening, first aid, the salaries of school nurses and/or doctors employed by local school districts and the expenses of health supplies. Data are from the Office of Education.

Programs for maternal and child health at the Federal level were established under Title V of the Social Security Act. They are designed to encourage, extend, and improve health services for mothers and children, especially in rural and low-income areas.

Under the maternal and child health program, Federal grants are matched and used by State health agencies to provide maternity clinics, well-child and pediatric clinics, inpatient hospital services, health services for school children, dental care, and immunization.

Under the crippled children's program, Federal grants are used by State health and crippled children's agencies to locate crippled children; to provide medical, surgical, corrective and other services and care for crippled children; and to provide facilities for diagnosis, hospitalization, and after-care for these children.

B 259, other. The category "other" includes the following: (1) temporary disability insurance, **(2)** other public health activities, (3) medical vocational rehabilitation, **(4)** special Office of Economic Opportunity (OEQ) programs, and **(5)** beginning **1966,** health insurance for the aged (Medicare).

The temporary disability programs, as enacted by four States (Rhode Island, California, New Jersey, and New York) in the 1940's, are designed to replace one-half or more of the weekly wage loss attributable to illness or off-the-job injury.

For a description of other public health activities, see text above for series B **231.**

Medical vocational rehabilitation refers to assistance given the physically and mentally handicapped so that they may be prepared for and placed in gainful occupations. Included among vocational rehabilitation basic services are such medical services as study and diagnosis to assess the extent of disability and the individual's work capacities; medical, surgical, and hospital treatment and related therapy to remove or reduce the disability; and provision of prosthetic devices. Data on Federal, State, and local expenditures for this program are provided by the Rehabilitation Services Administration.

The **OEQ** programs are aimed at developing and demonstrating more effective ways of delivering quality health care to poor families. OEO health funds include grants and contracts to aid local health services and resources and are reported in the *Special Analysis* of the *Budget* (see above for series B **254).**

Federal health insurance for the aged (Medicare) became effective July **1, 1966,** providing hospital and medical protection to an enrolled population aged **65** and over. Benefits under the hospital program (Part A) cover specified inpatient hospital services, post-hospital services in a "participating" extended-care facility, and home health visits. Under the supplementary medical program (Part B), payment is provided for physicians' services (including home and office visits), home health visits, outpatient hospital services, outpatient physical therapy services, diagnostic X-ray and laboratory tests, radiation therapy, prosthetic devices, ambulance services, and certain other medical supplies. Payments for deductibles, coinsurance, and noncovered services are not included here.

Financing of the hospital insurance program is on a self-supporting basis through a Federal tax applied to a portion of current earnings and paid by employees, employers, and self-employed persons. The tax proceeds are placed in the hospital insurance trust fund, from which benefits and administrative expenses are paid. The supplementary medical insurance program is financed through monthly premium payments paid by enrollees and matched by the Federal Government. These amounts are paid into the supplementary medical insurance trust fund from which benefits and administrative expenses are paid. Premium payments are thus included in the expenditures of the Medicare program.

For additional detail for public program expenditures, see U.S. Social Security Administration, *Personal Health Care Expenditures, by State,* vol. I, Public Funds, 1966 and **1969.**

B 262–274. Indexes *of* medical care prices, **1935–1970.**

Source: U.S. Bureau of Labor Statistics, *Consumer Price Index,* various monthly issues.

For description and historical development of the consumer price index, see text for series E 135–166.

See the source for more detail for various component indexes of medical care prices.

B 275–276. Physicians, **1850–1970.**

Source: Superintendent of the U.S. Census, **1850,** *Statistical View of the United States. . . a Compendium of the Seventh Census; 1860, Population of the United States in 1860.* U.S. Bureau of the Census, **1870–1930** (decennial years), Sixteenth Census Reports, *Comparative Occupation Statistics for the United States, 1870 to 1940,* p. **111; 1940** and **1950,** *U.S. Census of Population, 1950,* vol. II, part 1, pp. **1–266** to **1–269.** American Medical Association, **1870–1934,** R. G. Leland, *Distribution of Physicians in the United Slates,* Chicago, **1936,** pp. 7 and **79** (copyright); 1936–1957, the *American Medical Directory,*

vols. 14–20 (copyright). 1958 edition includes summary for 1906–1957. U.S. Public Health Service, 1958–1970, *Health Resources Statistics,* 1971, p. 147, and unpublished data; compiled from data provided by American Medical Association and American Osteopathic Association.

The census data for 1940 and 1950 are for employed civilian physicians; figures for prior census years are largely for gainful workers and may include physicians not in active medical practice. See text for series D 75–84 for explanation of difference between employed persons and gainful workers. The 1910 census figure includes osteopaths; earlier census figures include osteopaths, chiropractors, and healers (not elsewhere classified).

The *American Medical Directory* figures pertain to the total number of physicians, including those retired or not in practice for other reasons and those in the Federal service. They exclude graduates of the years concerned.

Population figures used to compute physician-population rate for census years, 1850–1930, include Armed Forces overseas; only the civilian population is used for 1940 and 1950. Rates for years prior to 1963, excluding 1960, are based on the Census Bureau population estimates as of July 1, including Armed Forces overseas. Rates for years 1960 and 1963–1970 are based on Census Bureau estimates of civilian population in the 50 States, District of Columbia, outlying areas, U.S. citizens in foreign countries, and the Armed Forces in the United States and abroad as of December 31.

B 277. Physicians admitted to U.S. as immigrants, 1901–1970.

Source: U.S. Public Health Service, *Foreign Trained Physicians and American Medicine,* DHEW Publication No. (NIH)73-325, table A1. Compiled from the U.S. Immigration and Naturalization Service data.

B 278–280. Medical schools, students, and graduates, 1810–1970.

Source: 1810–1840, American Medical Association, 1956 *American Medical Directory* (copyright); later years, annual reports of the Council on Medical Education and Hospitals of the American Medical Association as follows: 1850–1919, *Journal of the American Medical Association,* vol. 79, No. 8, pp. 629–633, Aug. 1922; 1920–1930, *Journal of the American Medical Association,* vol. 105, No. 9, p. 686, Aug. 1935; 1931–1957, Edward L. Turner, *et al., Journal of the American Medical Association,* vol. 165, No. 11, p. 1420, November 1957. (Copyright,) 1958–1970, U.S. Public Health Service, *Health Resources Statistics,* 1971, p. 88, and unpublished data.

Data on the number of medical schools, students, and graduates prior to 1900 are fragmentary and of dubious accuracy. The first medical school in the United States was founded in 1765. In 1800 three schools graduated students, with the number of schools increasing steadily from 52 in 1850 to a maximum of 162 in 1906. From 1906 to 1929, the number of schools declined sharply, largely because of the inspection and classification system begun in 1904 by the American Medical Association Council on Medical Education. By 1929, only one unapproved school remained.

B 281–282. Dentists, 1810–1970.

Source: 1810 and 1840, John T. O'Rourke and Leroy M. S. Miner, *Dental Education in the United States,* W. B. Saunders Co., Philadelphia, 1941, p. 298 (copyright). 1820 and 1830, Harris' *Principles and Practice of Dental Surgery,* Lindsay and Blakiston, Philadelphia, 1848, pp. 36–37. 1850–1950 (decennial years), same sources as series B 275–276. 1898–1928, *Polk's Dental Register and Directory of the United Slates and Dominion of Canada,* R. L. Polk and Co., Chicago, 1928, and prior editions (copyright). 1947–1957, *Distribution of Dentists in the United States by State, Region, District, and County,* American Dental Association, Chicago, 1958, and prior editions. (Copyright by the American Dental Association. Reprinted by permission.) 1958–1970, U.S. Public Health Service, *Health Resources Statistics,* annual issues, and unpublished data; compiled from American Dental Association data.

The census data for 1940 and 1950 are for employed civilian dentists; figures for prior census years are largely for gainful workers and may include dental students and dentists not in active dental practice. See text for series D 75–84 for explanation of difference between employed persons and gainful workers.

The 14 editions of *Polk's Dental Register and Directory of the United States and Dominion of Canada* list by State all dentists for 1893–1928. The *American Dental Directory,* first published in 1947, lists by State all dentists, including those retired or not in practice for other reasons and those in the Federal dental service. The figures for all dates include graduates of the years concerned.

Prior to 1963, the population figures used to compute the dentist-population rate are the same as those used for the physician-population rate. See text for series B 275–276. Population figures used to compute the dentist-population rate for 1963–1970 include all persons in the United States and in the Armed Forces overseas as of July 1.

B 283. Dental schools, 1840–1970.

Source: 1840–1945, Harlan Hoyt Horner, *Dental Education Today,* p. *30* (copyright 1947 by University of Chicago); 1946–1957, American Dental Association Council on Dental Education, *Dental Students' Register,* Chicago, annual publications (copyright). 1958–1970, U.S. Public Health Service, *Health Resources Statistics,* 1971, p. 77, and unpublished data.

Homer's data are compiled from Dorothy Fahs Beck, *The Development of the Dental Profession in the United States,* dissertation of the University of Chicago, 1932, and from records of the Council on Dental Education of the American Dental Association. Additional data may be obtained from the following sources cited by Beck: W. J. Gies, *Dental Education in the United States and Canada,* Carnegie Foundation for the Advancement of Teaching, Bulletin No. 19, 1926, p. 42; *Polk's Dental Register and Directory of the United States and Canada,* R. L. Polk and Co., Chicago, 1925, p. 35; W. J. Gies, "Additional Remarks on a Reference to the Carnegie Foundations Study of Dental Education," *Journal of Dental Research,* vol. 10, p. 32, February 1930; W. J. Greenleaf, *Dentistry,* Career Series, Leaflet No. 7, Office of Education, pp. 7–10. The Beck tabulation also appears in Frederick B. Noyes, "Dental Education, 1911–36," *Oral Hygiene,* vol. 26, p. 24, January 1936.

The first dental school in the United States was organized in 1840. Before that, all physicians practiced some dentistry, a few limiting their practice to this specialty. The dental practitioners who were not physicians learned their trade as apprentices or were self-taught. From 1840 to 1880 apprentice training was the chief source of supply, but by 1880 most States had enacted laws requiring graduation from a dental school.

B 284. Dental students, 1921–1970.

B 285. Dental graduates, 1850–1970.

Source: See source for series B 283.

Annual figures for graduates for 1841–1924, are also presented in *Polk's Dental Register,* 1925, p. 34; but the figures for the early years far exceed those shown elsewhere in histories of dentistry as well as those shown here.

B 286–287. Graduate nurses, 1910–1970.

Source: 1910–1950, U.S. Public Health Service, *Health Manpower Source Book 2, Nursing Personnel,* pp. 14–15. 1953 and 1955, Ameri-

can Nurses Association, *Facts About Nursing,* New York, 1956–57 edition, p. 8 (copyright). 1956–1970, U.S. Public Health Service, *Health Resources Statistics,* 1971, p. 177, and unpublished data; compiled from data provided by American Nurses Association.

The estimates for 1910–1950 were obtained by subtracting student nurses from the number of nurses reported in the decennial censuses.

Census data for 1910–1930 are for gainful workers; for 1940 they include employed nurses and those seeking work; and for 1950 they include employed civilian nurses. See text for series D 75–84 for explanation of difference between employed persons and gainful workers.

The estimates for 1953 and 1955 were prepared jointly by the American Nurses Association, the National League for Nursing, and the Public Health Service. They are based partly on information supplied by hospitals, schools of nursing, public health agencies, boards of education, and nursing homes. Estimates of nurses in private duty, doctors' offices, industry, and other nursing fields were based on the American Nurses Association Inventory of 1951 adjusted according to trends observed in more recent State surveys of nursing needs and resources.

Population figures used to compute nurse-population rates for 1910–1940 include Armed Forces overseas. The 1950 rate is based on the civilian population. Rates for 1953–1955 and 1958–1962 are based on the Census Bureau population estimates, including Armed Forces overseas, as of January 1 of the following year. Rates for 1964–1970 are based on Census Bureau population estimates for civilians and the Armed Forces in the United States as of December 31.

B 288–290. Nursing schools, students, and graduates, 1880–1970.

Source: 1880–1927 and 1931, U.S. Office of Education, *Biennial Survey of Education in the United States: 1934–36,* vol. 11, chap. IV, p. 294. 1929 and 1932, The Committee on the Grading of Nursing Schools, *The Second Grading of Nursing Schools,* New York, 1932, p. 9. 1935–1939, American Nurses Association, *Facts About Nursing, 1946,* New York, 1946, pp. 32 and 34; 1940–1955, *Facts About Nursing, 1957,* pp. 67 and 71 (copyright). 1956–1970, U.S. Public Health Service, *Health Resources Statistics,* 1971, p. 181; compiled from data provided by American Nurses Association.

> Nursing education began in this country in 1873 with the opening of three schools. These schools offered students an opportunity to learn by doing. under the tutorship for 1 year of a superintendent who had been trained in one of the European schools. ... By 1893 about 70 schools were in operation.. .. As State licensing bodies came into existence, counts of State approved schools and of their students began to he availahle. Since only graduates of State approved schools could stand for licensure examinations, nonapproved schools tended to close as the effect of licensure berame felt. Not until 1923 was machinery for approving schools in operation in every State. (U.S. Public Health Service, *Health Manpower Source Book 2, Nursing Personnel,* p. 33.)

B 291–304. Rates per 100,000 population for specified reportable diseases, 1912–1970.

Source: 1912–1919, U.S. Public Health Service, *Public Health Reports,* various issues; 1920–1950, U.S. National Office of Vital Statistics, *Vital Statistics — Special Reports,* vol. 37, No. 9; 1951–1970, U.S. Center for Disease Control, *Morbidity and Mortality, Weekly Report,* Annual Supplement, Summary, 1960 and 1970.

The rates refer to the number of notifiable diseases occurring within the United States per 100,000 population. For 1920–1970, rates are based on the total resident population. Each State makes its own laws and regulations prescribing the diseases to be reported, the agencies and persons required to report, and penalities for failure to report. All States have entered voluntarily into a cooperative agreement to report to the Federal Government.

The notification of disease in the United States began in the colonial period on a local basis, particularly in port cities. It was usually limited to periods when epidemics of pestilential disease threatened or were in progress. Statewide notification was not required until 1883, when Michigan passed a law requiring physicians and householders to report certain diseases to health officers or boards of health. During the next three decades all States made similar requirements.

In response to the need for nationwide statistical information on epidemic diseases, a law was passed in 1878 providing for the collection of such statistics. By 1912, data were supplied regularly by 19 States and the District of Columbia on diphtheria, measles, poliomyelitis, scarlet fever, tuberculosis, typhoid fever, and smallpox. State health authorities now report weekly on 25 diseases and annually on about 40. Most States require the reporting of additional diseases.

The Public Health Service has changed its form of reporting several times and some of the rates shown here do not appear in the published reports. Since the data were originally shown only for the individual States, a rate for the country was obtained for each disease by combining the information only for those States reporting it, the denominators being the population of the reporting States.

For trends of sickness and accident among groups of male and female industrial workers (1917–1950, for cases disabling for 1 day or longer, and 1921–1952, for cases disabling for 8 days or longer), see W. M. Gafafer, "Industrial Sickness Absenteeism Among Males and Females During 1950," *Public Health Reports,* vol. 66, No. 47, pp. 1550–1552, November 1951. See also "Rates for Specific Causes in 1952 for the Year and Last Two Quarters — Industrial Sickness Absenteeism," *Public Health Report,* vol. *68,* No. 11, pp. 1052–1055, November 1953; and S. D. Collins, "Long-Time Trends in Illness and Medical Care," *Public Health Monograph,* No. 48, p. 32.

Civilian illness rates for the United States are not available for a long period. However, records of illness (admission to sick report) among the active-duty personnel of the Army are available back to 1819, and those for the Navy back to 1865. See U.S. Army, *Annual Reports of the Surgeon General on Medical Statistics,* and U.S. Navy, *Annual Reports of the Surgeon General on Medical Statistics.* For annual days sick per person, computed from Army and Navy data, see S. D. Collings, "Long-Time Trends in Illness and Medical Care," *Public Health Monograph,* No. 48, p. 37.

B 305–400 and B 413–422. General note.

Until 1953, when it discontinued registration of hospitals, the American Medical Association (AMA) collected data annually from all hospitals registered by it, and published them in the Hospital Number of the *Journal of the American Medical Association.* Registration was a basic recognition extended to hospitals and related institutions in accordance with requirements officially adopted by its House of Delegates.

Figures from the AMA presented in series B 319–330, B 345–358, and B 371–380 are not entirely comparable with similar data provided by the American Hospital Association (AHA) because the standards required for "listing" or "recognition" of hospitals by the AHA differ from those required by the AMA. Statistics of hospitals obtained from the AHA's annual survey of hospitals are published annually in *Hospitals,* Guide Issue, and cover all hospitals accepted for registration by the AHA. To be accepted for registration, a hospital must meet certain requirements, as follows: It must have at least 6 beds for the care of nonrelated patients for an average stay of over 24 hours per admission; be constructed and equipped to insure safety of patients and to provide sanitary facilities for their treatment; have an organized medical staff, registered nurse supervision, and nursing care for round-the-clock patient care; maintain clinical records on all patients and submit evidence of patient care by doctors; provide minimal surgical and obstetrical facilities or relatively complete diagnostic and treatment facilities; have diagnostic X-ray and clinical laboratory services readily available; and offer services more intensive than those required merely for room, board, personal services, and general nursing care.

Short-term hospitals are those in which over 50 percent of all patients admitted have a stay of less than 30 days; long-term, those in which over 50 percent of all patients admitted have a stay of 30 days or more. General hospitals accept patients for a variety of acute medical and surgical conditions, and, for the most part, do not admit cases of contagious disease, tuberculosis, and nervous and mental

disease. Special hospitals are those devoted to the treatment of some particular disease or group of diseases or some particular group in the population. Among the former are orthopedic, contagious disease, chronic and convalescent, and eye, ear, nose, and throat hospitals; the latter include maternity, children's, and industrial hospitals. Psychiatric hospitals include those providing temporary or prolonged care for the mentally ill, the mentally retarded, epileptic, and persons with alcoholic or other addictive diseases. Tuberculosis hospitals include sanatoria or hospitals specifically for the care of tubercular patients.

Governmental hospitals include those operated by Federal, State, and local governments, the latter including county, city, city-county, and hospital district. Nonprofit hospitals are those operated not for profit by churches and by associations of citizens or fraternal organizations. Proprietary hospitals are operated for profit by individuals, partnerships, or corporations.

Number of beds includes beds, cribs, and pediatric bassinets normally available for inpatients. It excludes newborn infant bassinets.

Data from the AHA relate generally to the year ending September 30 or to the fiscal year closest to that date.

B 305–318. Hospitals and beds, by type **of** service and ownership (AHA), 1946–1970.

B 359–370. Average daily census and admissions to hospitals, by type **of** service and ownership (AHA), 1946–1970.

Source: See source for series B 305–318.

Average daily census is defined as the average number of inpatients receiving care each day during the 12-month period, excluding the newborn.

Admissions refer to the number of patients accepted for inpatient service during the 12-month period, either as first admissions or readmissions. Births are excluded.

Payroll expenses include all salaries and wages except, beginning 1951, those paid to interns, residents, student nurses, and other trainees. All professional fees and the salary expenditures excluded from payroll are defined as nonpayroll expenses and are included in total expenses.

See also general note for series B 305–400 and B 413–422.

B 401–412. Persons covered by private health insurance for hospital and surgical benefits, 1939–1970.

Source: U.S. Social Security Administration, *Social Security Bulletin,* February 1973 and earlier issues.

The data for insurance companies are from the Health Insurance Institute, *Source Book of Health Insurance Data,* and were developed from surveys and reports of insurance companies and other health insurance plans, government agencies, and hospital and medical associations. The data for Blue Cross–Blue Shield are from annual reports of the Blue Cross–Blue Shield Associations. The data for independent plans—plans other than Blue Cross–Blue Shield and insurance companies—are from annual surveys of these plans by the Social Security Administration.

In 1970, there were many different health insurance organizations in the United States—75 Blue Cross plans, 72 Blue Shield plans, about 1,000 commercial insurance companies, and more than 500 independent plans. They insured in varying degree against the costs of hospital and surgical care, other physicians' services, nursing care, dental and vision care, and prescribed drugs.

Health insurance policies, both group and individual, are written by health insurance companies, as well as by life and health, casualty, and multiple line companies.

Because one plan may provide only one type of benefit and because the benefits may be limited, families frequently carry several forms of health insurance; for example, Blue Cross for hospital insurance, Blue Shield for surgical insurance, in-hospital medical expense insurance, and an insurance policy applicable to all three types of expense. Multiple coverage may also occur when husband and wife are both employed and both cover self, spouse, and dependents under the insurance plan at the work place.

Hospitalization insurance provides benefits for hospital charges incurred by an insured person because of an illness or injury. Surgical insurance pays benefits toward physicians' surgical fees. The Social Security Administration publishes its own estimates of the net number (of different persons) and the percentage of the civilian population covered by hospital and surgical insurance. These estimates, which usually run **5–10** percentage points lower than those published by the Health Insurance Institute, are based on household interviews conducted by the National Center for Health Statistics (NCHS) during **1967** and **1968,** and on findings of various household surveys by the Health Information Foundation and the Public Health Service in **1953–1963.**

B **413–422.** Hospitals — assets, expenses, and personnel, by type **of** control and service, **1946–1970.**

Source: See source for series B **389–400.**

Assets comprise plant assets (land, buildings, equipment, and reserves for construction, improvement, and replacement — less deductions for depreciation) plus all other assets, including endowment fund principal and general and temporary fund balances.

Expenses include all expenses covering the 12-month period, both total and payroll. Payroll expenses include all salaries and wages except those paid to interns, residents, student nurses, and other trainees. All professional fees and those salary expenditures excluded from payroll are defined as nonpayroll expenses and are included in total expenses.

Data on personnel refer to the number of persons on the payroll at the close of the 12-month reporting period. Except as noted, they include full-time equivalents of part-time personnel but exclude trainees (student nurses, interns, residents, and other trainees), private duty nurses, and volunteers. Full-time equivalents are calculated on the basis that two part-time persons are equal to one full-time person.

See also general note for series B **305–400** and B **413–422.**

B 423–427. Patients in mental hospitals, by type **of** hospital, **1904–1970.**

Source: U.S. Census Office, **1904,** *Insane and Feeble-Minded in Hospitals and Institutions, 1904* (special report). **U.S.** Bureau of the Census, **1910,** *Insane and Feeble-Minded in Institutions, 1910;* **1923–1946,** *Patients in Mental Institutions* (annual reports, varying titles). U.S. National Institute of Mental Health, **1947–1966,** *Patients in Mental Institutions,* annual issues; **1967–1970,** *Mental Health Statistics,* Series **A,** Reference Tables, and unpublished data.

For **1923–1932,** the annual enumerations of patients in mental institutions, conducted by the Bureau of the Census, were confined to State hospitals for mental disease and State institutions for mental defectives and epileptics. Since **1933,** the annual censuses conducted by the Bureau of the Census until **1946** and subsequently by the National Institute of Mental Health (NIMH) have covered all types of hospitals and institutions caring for the mentally ill, mental defectives, and epileptics. For a discussion of these developments, see the 1947 issue of NIMH, *Patients in Mental Institutions,* pp. **1–4.** Additional information on admissions, patients, personnel, and expenditures of institutions for mental defectives and epileptics, as well as for hospitals for mental diseases, appear in various issues of that report.

The figures represent patients who are resident in hospitals which provide care solely for the mentally ill, as distinguished from the physically ill and from the mentally deficient and epileptic. These hospitals may provide care over an unlimited period of time or temporary care, as in psychopathic hospitals. Hospitals included are those under control of State and local governments, nonprofit and Proprietary organizations, the Veterans Administration, and the Federal Government in the District of Columbia (included here under State hospitals).

These facilities contain **93** percent of the psychiatric beds. (The other **7** percent are in general hospitals and residential treatment centers for emotionally disturbed children.) The number of resident patients in these hospitals peaked in **1965** (the year during which the use of tranquilizers became widespread in these hospitals) and has decreased since. Coupled with this decrease in residents is an increase in admissions offset by the practice of returning many hospitalized patients to the community for treatment.

There are also programs for preventing hospitalization in the many outpatient psychiatric clinics and community mental health centers. These, along with the general hospital psychiatric services, provide about three-fourths of the care to the mentally ill in the existing psychiatric facilities.

B 428–443. Public institutions for the mentally retarded, **19364970.**

Source: **1936–1945,** U.S. Bureau of the Census, *Patients in Mental Institutions, 1946,* pp. **31** and **35–37; 1946–1970,** U.S. Social and Rehabilitation Service, *Residents in Public Institutions for the Mentally Retarded,* annual issues.

From **1946** to **1968** the National Institute of Mental Health was responsible for collecting and publishing data on the institutionalized mentally retarded in the United States. Since **1969,** the annual census of the public institutions of the mentally retarded has been the responsibility of the Social and Rehabilitation Service.

B 432–433, admissions. Includes first and readmissions. First admissions are all patients admitted to a public institution for the mentally retarded without a record of previous care, i.e., a record of an admission and a formal discharge, in either a public or private institution anywhere. Thus, a patient coming into a public institution for the mentally retarded from a hospital for mental disease would be considered a first admission. Readmissions are all patients admitted with a record of previous care in a public or private institution. Admissions per 100,000 civilian population, series B **433,** measures the proportion of people coming under care during the year.

B 435, deaths in institutions. This category includes only deaths occurring to patients resident in the institution and does not include deaths among patients on leave, even though these patients are still on the institution books.

B 436, net live releases. This concept takes into account movement of patients into and out of the institution since this quantity is the number of placements on extramural care plus direct discharge from the institution less the number of returns from extramural care, all occurring during any one year. National data on placements and returns from extramural care are not available but net releases may be computed from less detailed movement data as:

Net live releases = **Resident patients beginning** of year + **All admissions excluding transfers** − **Deaths** in institution − **Resident patients end** of **year**

Interpretation of net live releases should be made with caution. This quantity is the net number of releases alive from the public institutions in the State system and includes not only direct discharges to the community and placement on leave but also direct discharges to other inpatient facilities outside the State system such as public mental hospitals, boarding care homes, and public institutions in other States. The number of net releases is used as a measure of movement out of the institution rather than the total number of discharges because many discharges occur while patients are already outside the institution on extramural care. The number of net releases may be considered an estimate of the number of effective releases from the institution under the assumption that subtracting returns from leave during the year removes only the short term visits, leaves, and escapes, and retains the effective releases; i.e., those from which the patients did not return to the institution within the time period covered.

B **442–443,** expenditures per average daily resident patient. The most commonly used ratio for comparing institution expenditures. Its major limitation is that it does not adequately take into account

the number of admissions for which a large share of the expenditure is required. If the patient base were enlarged to include admissions during the year, the resulting sum would be the best available estimate of patients under treatment during the year.

B 444–447. Four indexes of per capita food consumption, **1909–1970.**

Source: U.S. Department of Agriculture, Economic Research Service, *Food Consumption, Prices, and Expenditures,* Agricultural Economics Report No. **138** and its *Supplement for* 1971, tables **1, 5, 6,** and **38.**

Three methods are commonly used to measure the total amount of food consumed, or otherwise "disappearing" through the marketing system. Total food consumed is measured in terms of its monetary value, physical weight, or nutritive value.

Civilian disappearance, the residual from all other known uses, normally is the estimate of annual U.S. civilian food consumption. This estimate is usually derived from supply and utilization "balance sheets," which summarize production, imports, and beginning stocks; and deduct exports, all known nonfood uses, military procurement, and end-of-year inventories of each commodity. The residual, after adjustment for marketing losses up to the retail level, is assumed to have been consumed for food.

B 444, food consumption. This index measures per capita consumption (civilian, beginning **1941)** of quantities of individual foods measured in pounds equivalent to the form sold at retail food stores. The quantities used for this series have been combined into indexes on the basis of average **1947–49** retail prices through **1954** and **1957–59** prices thereafter; the indexes are linked at 1955. Component indexes for individual groups of animal and crop products are presented in the source (table **1).** For comparison with the food *use index,* see below.

B 445, food use. In concept, this index parallels the food consumption index, except that it combines farm products ultimately used for food (farm weight or an equivalent) weighted by constant prices received by farmers, or an equivalent. It is a component of the system of index numbers that integrates the entire supply and utilization of farm commodities at the farm level (see tables **91–93** in the source). It is not available in as much detail as the food consumption index, but serves as a check on it.

The food consumption and food use indexes are based on roughly the same kind of data. But development of the food consumption index at the retail rather than the farm level introduces variations among products in farm-retail marketing margins into its weighting scheme. Consequently, crop products are more heavily weighted in the food consumption index than in the food use index (see tables 4 and **93** in source).

Shifts in consumption are reflected in these indexes. A 1-pound increase in consumption of a relatively high-priced food (meat, for example) and a simultaneous 1-pound decrease in consumption of a relatively low-priced food (potataes, for example) would result in an increase in both indexes. Major differences in the forms in which food is sold affect the food Consumption index. For example, fruits and vegetables sold fresh and those sold in processed form are weighted separately. Accordingly, the index reflects, to a limited extent, the trend toward consumption of more highly processed foods.

The food use index tends to reflect changes in the form of agricultural commodities sold by farmers. Instead of weighting individual food items on the basis of price, as is done in the food consumption index, the food use index weights food groups, such as dairy products, fruits, and vegetables. This difference makes the food consumption index more sensitive to smaller shifts in food consumption patterns than the food use index.

B 446, food consumed, pounds. This index was based on data presented in pounds in the source (table **6).** Pounds of the various foods consumed are totaled on the basis of retail weight, or an equivalent, to achieve consistency in aggregating grossly different foods. Nevertheless, the different forms in which food is marketed and the problems of summing pounds of liquids, solids, and concentrated products make it difficult to interpret changes in these data. Quantities of food consumed are roughly equivalent to the weight of food sold (or at least saleable) by retail food stores. No aggregation of pounds at the farm level has been made, partly because of the problem of allocating joint raw farm products among various ultimate food and nonfood uses.

B 447, calories per day. This index was computed from data presented in calories of food energy available for consumption per capita per day in the source (table **38).** These data were in turn based on estimates of per capita food consumption (retail weight), including estimates of produce of home gardens. No deduction was made for loss or waste of food in the home nor use for pet food.

B 448–452. Index of per capita consumption of selected nutrients, **1909–1970.**

Source: U.S. Department of Agriculture, Economic Research Service, *Food Consumption, Prices, and Expenditures,* Agricultural Economics Report No. **138** and its *Supplement for* 1971, table **38;** and *National Food Situation,* NFS-142, table *10.*

These indexes were computed from data presented in the source in terms of grams and milligrams. The nutritive value of food is measured by the amount of food energy (see calories per day, series B 447), protein, fat, carbohydrate, and several vitamins and minerals it contains.

The data on nutrients are derived by applying composition values to food consumption data reported in terms of retail weight equivalents. Allowances are made for bones, rinds, and peelings, but not for bruises and rot. No deduction is made for nutrient losses that occur in household storage and meal preparation. Quantities of food discarded as plate waste or fed to pets are not deducted. As a result, these data overstate nutrients actually ingested.

For additional data on other nutrients, see source.

B 453–459. Controlled fluoridation of water systems, **1945–1970.**

Source: Series **B 453–455** and **B 457–459, 1945–1969,** U.S. Public Health Service, *Fluoridation Census* 1969, table **3;** 1970, unpublished data. Series **B 456,** computed on basis of **U.S.** resident population in series **A** 7.

Controlled fluoridation is defined as the conscious maintenance of the optimal fluoride concentration in the water supply. This may be accomplished by adding fluoride chemicals to fluoride-deficient water; by blending two or more sources of water naturally containing fluoride to the optimal concentration; or by defluoridation, that is, removing fluorides in excess of the recommended level. Water supply systems are considered to have natural fluoridation if they contain 0.7 parts per million or more naturally occurring fluoride. (See *Natural Fluoride Content of Community Water Supplies, 1969,* Division of Dental Health, U.S. National Institutes of Health.)

The current population on controlled fluoridation was estimated by applying the Bureau of the Census population projection factors to the population on fluoridated water expressed in terms of the **1960** census population.

The data on operative and discontinued systems are based upon the year in which institution, discontinuation, or reinstitution of fluoridation (shown separately in the source) were reported to the U.S. Public Health Service and not necessarily the year in which the event occurred.

[1] Services of registered and practical nurses in private duty, visits of nurses, podiatrists, physical therapists, clinical psychologists, chiropractors, naturopaths, and Christian Science practitioners.

[2] Research expenditures of drug companies included in expenditures for drugs and drug sundries and excluded from research expenditures.

[3] Includes fees of optometrists and expenditures for hearing aids, orthopedic appliances, artificial limbs, crutches, wheelchairs, etc.

[4] Includes the net cost of insurance and administrative expenses of federally financed health programs.

[5] Based on July 1 data from the Bureau of the Census for total U.S. population, including Armed Forces and Federal civilian employees overseas and the civilian population of outlying areas.

*Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Beginning 1960, includes osteopaths.
[2] Beginning 1954, includes Puerto Rico; beginning 1960, includes osteopaths and their schools.
[3] Approved medical and basic science schools.
[4] Beginning 1958, excludes graduates of year stated.
[5] For 1840 and 1926–1931, schools offering courses in dentistry; for 1850–1925, schools conferring degrees; for other years, schools in operation. Includes Puerto Rico.
[6] Includes Hawaii and Puerto Rico beginning 1950 for number and students and 1952 for graduates.
[7] Census estimate adjusted to exclude student nurses enumerated as graduates.
[8] Reflects enrollment of more than 1 class in some schools under accelerated program in operation during World War 11.

Series B 291–304. Rates Per 100,000 Population for Specified Reportable Diseases: 1912 to 1970

[Rate per 100,000 population enumerated as of April 1 for 1940, 1950, 1960, and 1970. and estimated as of July 1 for all other years]

* Denotes first year for which figures include Alaska and Hawaii.
Z Less than 0.05.
[1] Includes Alaska and Hawaii for all years. Prior to 1953, active and inactive cases; thereafter, new active cases only.
[2] Beginning 1950, excludes paratyphoid fever.
[3] 1912–1919, excludes streptococcal sore throat.
[4] 1950–1952, infectious only; thereafter, infectious and serum. Reportingincomplete.
[5] Includes Alaska.

* Denotes first year for which figures include Alaska and Hawaii.

[1] Includes full-time equivalents of part-time personnel; beginning 1951, excludes residents, interns, and students.

[2] Includes Alaska.

[1] Net number of different persons covered as estimated by Health Insurance Association of America (HIAA), an association of insurance companies. Estimate of net number enrolled exceeds summary of individual categories for early years because HIAA data includr estimated enrollment of college and university health services.

[2] For 1939, based on total population; all other years based on Bureau of the Census estimates of the civilian population as of end of year.

[3] Plans — community group and individual practice plans, employer-employee-union group and individual practice plans, private group clinics, and dental service corporations— not affiliated with Blue Cross-Blue Shield or insurance companies.

Series **B 413–422.** Hospitals — Assets, Expenses, and Personnel, by Type of Control and Service: 1946 to 1970

[Covers hospitals accepted for registration by the American Hospital Association]

* Denotes first year for which figures include Alaska and Hawaii.
[1] Composed of both general and other special.
[2] Includes Alaska.
[3] Excludes cost of new construction.
[4] Beginning 1951, excludes residents, interns, and students; beginning 1954, includes full-time equivalents of part-time personnel.

Series B 423–427. Patients in Mental Hospitals, by Type of Hospital: 1904 to 1970

*Denotes first year lor which figures include Alaska and Hawaii.
[1] Patients per 100,000 population estimated as of July 1. Total population used prior to 1936; civilian, thereafter.
[2] Includes veterans with mental disorders resident in VA hospitals and, through 1965, all patients in public health service hospitals at Fort Worth. Tex., and Lexington, Ky.
[3] Includes patients in State-operated psychopathic hospitals and, through 1950, in city hospitals.
[4] Includes Alaska.
[5] Beginning 1959, includes Alaska; 1960, Hawaii.
[6] Includes county hospitals.
[7] State mental hospitals only.

Series B 428–443. Public Institutions for the Mentally Retarded: 1936 to 1970

Year	Number of facilities	Resident patients, beginning of year	Patients per 100,000 population [1]	Patients in public institutions (1,000)	Admissions, excluding transfers: Number	Admissions, excluding transfers: Rate per 100,000 civilian population [3]	Patients under treatment	Deaths in institutions	Net live releases [4]	Resident patients, end of year	Average daily resident patient population	Personnel, full-times: Total	Personnel, full-times: Rate per 100 average daily resident natient population	Maintenance expenditures [5 6]: Total (mil. dol.)	Maintenance expenditures: Per average daily resident patient: Per (year)	Per (day)

[1] Population estimated as of July 1. Total population used prior to 1936; civilian, thereafter.
[2] Includes city institutions through 1945.
[3] Based on Bureau of the Census estimated resident population as of July 1.
[4] Excess of patients released alive from hospital over those returning to hospital.
[5] Reporting facilities only.
[6] Includes salaries and wages, purchased provisions, fuel, light, water, etc.

Series B 444-447. Four Indexes of Per Capita Food Consumption: 1909 to 1970

[1967 = 100. Beginning 1941, civilian consumption only]

Migration

Internal Migration (Series C 1-88)

C 1–75. General note.

Data in these series are based on comparison of State of birth and State of residence of the native population enumerated at successive decennial censuses of population. The migration measured is the net movement from the time of birth to the census date. Migrants defined in this way include only those persons who have moved from one State to another and are, *on the census date,* living in States other than those in which they were born.

These statistics for migrants do not represent the total number of persons who have moved from the State or geographic division in which they were born to other States or divisions during any given period of time. Some of those who moved from one State to another died before the following census date. Some moved from and returned, between censuses, to their State of birth. Others moved to places outside the conterminous United States.

A native is defined as a person born in the United States, Puerto Rico, or an outlying area of the United States or persons born in a foreign country who have at least one parent born in the United States. Persons for whom place of birth was not reported are included under native. See also text for series A 105–118, A 119–134, and A 135–142 and general note, A 1–871.

Through 1950, the figures showing classification by race were not ordinarily based on replies to census questions asked by enumerators, but were rather obtained by observation. The figures do not, therefore, reflect a clear-cut definition of biological stock. The population of Negro and other races consists of Negroes, American Indians, Japanese, Chinese, Filipinos, and some other groups. Persons of mixed white and other parentage were placed in the classification of the parent who was not white. Persons of Mexican birth or ancestry who are not definitely Indian or of stock other than white have been classified as white in all censuses except that of 1930. The lack of comparability introduced by this factor is substantial in the West South Central, Mountain, and Pacific Divisions. For revised 1930 figures for regions showing Mexicans classified as white, see series B 216–230 in *Historical Statistics of the United States, 1789–1945.*

For a discussion of 1960 and 1970 data on race and a more complete statement concerning earlier years, see text for series A 91–104.

C 1–14. Native population, by residence within or outside State, division, and region **of** birth, **by** race, **1850–1970.**

Source: Special compilations made by the University of Pennsylvania Studies of Population Redistribution and Economic Growth from the following U.S. Bureau of the Census reports: 1850, *The Seventh Census of the United States: 1850,* pp. xxxvi–xxxviii; 1860, *Eighth Census of the United States: 1860,* table 5 for each State, pp. 10–589 (various pages) and pp. 616–619; 1870, Ninth Census Reports, vol. I, pp. 327–335; 1880, Tenth Census Reports, *Population;* pp. 484–491; 1890, Eleventh Census Reports, *Population,* part 1, pp. 564–567 and 576–579; 1900, Twelfth Census Reports, *Population,* vol. I, part 1, pp. 686–693 and 702–705; 1910, Thirteenth Census Reports, *Population,* vol. I, pp. 730–744; 1920, Fourteenth Census Reports, *Population,* vol. II, pp. 626–640; 1930, Fifteenth Census Reports, *Population,* vol. 11, pp. 153–167; 1940, Sixteenth Census Reports, *State of Birth of the Native Population,* pp. 20–39; 1950, *U.S. Census of Population: 1950,* vol. IV, Special Reports, *State of Birth;* pp. 4A–24 to 4A–43; 1960, *U.S. Census of Population: 1960,* vol. II, Subject Reports, *State of Birth;* 1970, *U.S. Census of Population: 1970,* vol. II, Subject Reports, *State of Birth.*

In 1860, persons who were born in territories and who were then residing in territories were assumed to be residing in the territory of their birth.

See general note for series C 1–75 for definition of race and nativity; see also text for series A 172–194 for definition of division and region.

C 15–24. Native population born in each division, by division **of** residence, by race, 1850–1970.

Source: See source for series C 1–14.

See also general note for series C 1–75 for definition of race and nativity.

C 25–75. Estimated net intercensal migration **of** total, native white, foreign-born white, and **Negro** population, by States, **1870–1970.**

Source: Components of change method, U.S. Bureau of the Census, Current Population Reports, *Population Estimates and Projections,* series p. **25,** No. *72,* **p. 5;** No. 304, p. 12; and No. 406, pp. 10 and 14. Survival rate method, 1870–1950, Everett S. Lee, Ann Ratner Miller, Carol P. Brainerd, and Richard **A.** Easterlin, *Population Redistribution and Economic Growth: United States, 1870–1950,* vol. *I,* the American Philosophical Society, Philadelphia, 1957, pp. 107–231 (copyright). 1950–1960, Hope T. Eldridge, *Net Intercensal Migration for States and Geographic Divisions of the United States, 1950–1960* (Analytical and Technical Reports, No. 5) Population Studies Center, University of Pennsylvania, Philadelphia, table A-1 (copyright).

The estimate of the net migration data shown for the component of change method was obtained by subtracting the national increase for the intercensal period (births minus deaths) from the difference between the census counts at the beginning and the end of the period.

The estimates of net migration by the survival rate method were obtained by a residual method, using survival ratios derived from census data. The loss through mortality during an intercensal period was estimated on the basis of the ratios of appropriate age groups as enumerated in successive decennial censuses. The difference between the enumerated population at the end of the decennial period and the estimated survivors from the beginning to the end of the period was assumed to be net migration. Computations were by age groups for each sex, the figures presented in series C 25–75 being summations for ages 10 years and over at the end of each intercensal period. For the native population, the figures show the estimated amount of net internal migration. For the foreign born, the figures represent the estimated net change attributable to direct movement into the State from abroad and the net gain or loss in the exchange of foreign-born residents with other States.

See general note for series C 1–75 for definition of race and nativity.

C 76-80. Estimated annual movement of the farm population, **1920–1970.**

Source: U.S. Department of Agriculture, Economic Research Service, 1920–1962, *Farm Population Estimates for 1910–1962*, ERS-130, 1963; 1963–1970, *Farm Population Estimates*, annual issues.

Estimates of the total farm population and of the annual changes in its components have utilized data from the censuses of population and agriculture and the Current Population Survey, conducted by the Bureau of the Census, and surveys of the Department of Agriculture. For a history of the procedures used and the successive revisions of the series, see Department of Agriculture, *Major Statistical Series of the U.S. Department of Agriculture*, vol. 7, Agricultural Handbook No. 365, 1969.

Farm population figures relate to the rural civilian population living on farms, regardless of occupation or source of income. From 1850 to 1960 the definition of a farm has varied. See general note for series K 1–203 and text for series K 1–3 for discussion of the changes in definition. Since 1960 a farm is defined as a place of 10 acres or more from which at least $50 worth of farm products were sold in the preceding year, or a place of less than 10 acres from which at least $250 worth of products were sold. Persons living on or what might be considered farmland are classed as nonfarm if they rent for cash a house and yard only. Likewise, persons in institutions, summer camps, motels, and tourist camps located in the open country are also classed as nonfarm.

C 81-88. Mobility status and type of mobility of the population one year old and over, **1947–1970.**

Source: U.S. Bureau of the Census, *Current Population Reports*, series P-20, No. 235.

The population was classified by mobility status on the basis of a comparison between the place of residence of each individual on the survey date and the place of residence one year earlier. Persons classified as movers include all those whose place of residence in the United States was different at the end of the period and at the beginning of the period.

For similar information for earlier years, see Donald J. Bogue, Henry S. Shryock, Jr., and Siegfried A. Hoermann, "Subregional Migration in the United States, 1935–40," vol. 1, *Streams of Migration Between Subregions*, Scripps Foundation Studies in Population Distribution, No. 5, Miami, Ohio, 1957.

More Recent Data for *Historical Statistics* Series

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the ***Statistical Abstract of the United States***, beginning with the **1975** edition. For direct linkage of the historical series to the tables in the ***Abstract***, see Appendix I in the ***Abstract***.

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Based on 5-percent sample.
[2] Based on 25-percent sample.
[3] Based on 20-percent sample.
[4] Excludes Mexicans: classified under "other races."
[5] Excludes population of Indian Territory and Indian reservations, specially enumerated in 1390, with a native population of 117,368 white and 208,083 Negro and other races, not distributed by State of birth.
[6] Includes free Negroes.
[7] Includes Mexicans.

Series C 25–75. Estimated Net Intercensal Migration of Total, Native White, Foreign-Born White, and Negro Population, by States: 1870 to 1970

[In thousands]

Chapter C

International Migration and Naturalization (Series C 89-331)

C **89–157.** General note.

The continuous record of immigration to the United States began in 1819, under the Act of 1819, which required the captain or master of a vessel arriving from abroad to deliver to the local collector of customs a list or manifest of all passengers taken on board, This list was to designate the age, sex, and occupation of each passenger, "the country to which they severally belonged," and the number that had died on the voyage. Copies of these manifests were to be transmitted to the Secretary of State, who reported the information periodically to Congress. Subsequently, the Act of 1855prescribed quarterly reports to the Secretary of State and annual reports to Congress. Later acts have continued to require the collection of such information.

Although the reporting of alien arrivals was required by the Act of 1798, which expired two years later, the number arriving before 1819 is not known. William J. Bromwell, in his *History of Immigration to the United States,* 1856 (pp. 18–19), estimated the number of passengers of foreign birth arriving here from the close of the Revolutionary War to 1819, at 250,000. This estimate was used by the Bureau of Statistics which later compiled the official statistics of immigration.

Immigration statistics were compiled by the Department of State for 1820–1870; by the Treasury Department, Bureau of Statistics, for 1867–1895; and since 1892, by a separate Office or Bureau of Immigration, now a part of the Immigation and Naturalization Service. For 1892–1932, the Bureau of Immigration issued annual reports. For 1933–1940, the data were summarized in the *Annual Report of the Secretary oj Labor;* for 1941, they were issued in the *Annual Report of the Attorney General;* for 1942, no report was published; and for subsequent years, the statistics appeared in the *Annual Report of the Immigration and Naturalization Service.*

Since 1820 the official immigration data have undergone many changes in the reporting area covered. During the first decades only arrivals by vessel at Atlantic and Gulf ports were reported. Arrivals at Pacific ports were first included in 1860. During the Civil War the only Southern ports that reported were those controlled by the Federal Government. Later the reporting area was expanded to include arrivals at outlying possessions, Arrivals in Alaska were first reported in 1871, but only irregularly thereafter until 1904, after which Alaska was regularly included among the places of entry. Arrivals in Hawaii were first included in 1901, Puerto Rico in 1902, and the Virgin Islands in 1942.

Counting arrivals at the land borders was not required by the early immigration acts, and the counting of such arrivals did not approach completeness until after 1904. For 1820–1823, a few arrivals by land borders were included. Complete reporting was attempted in 1855 with only partial success, was interrupted for several years by the Civil War, and was discontinued in 1885. Beginning in 1894, European immigrants who arrived at Canadian ports with the declared intention of proceeding to the United States were included in the immigration statistics. Some immigration was reported at land border stations established in 1904. More stations were opened in the following years, but reporting of land border arrivals was not fully established until 1908.

The statistical treatment of Canadian and Mexican immigrants at times has differed from that of other immigrants. When reporting of arrivals by lend borders was discontinued in 1885, regular reporting of Canadian and Mexican arrivals by vessel was also discontinued; however, a few Canadian and Mexican immigrants were reported in most of the following years. Arrivals of Canadians and Mexicans by land borders began to be reported in 1906, and reporting was fully established in 1908under authority of the Act of 1907, which provided for the inspection of Canadians and Mexicans at the land borders.

Not all aliens entering via the Canadian and Mexican borders are counted for inclusion in the immigration statistics. Before 1930, no count was made of residents of a year or longer of Canada, Newfoundland, or Mexico who planned to remain in the United States less than 6 months. For 1930–1945the following classes of aliens entering via the land borders were counted and included in the statistics of immigration:

(1) Those who have not been in the United States within 6 months, who come to stay more than 6 months; (2) those for whom straight head tax is a prerequisite to admission, or for whom head tax is specially deposited and subsequently converted to straight head tax account; (3) those required by law or regulation to present an immigration visa or re-entry permit, and those who surrender either, regardless of whether they are required by law or regulation to do so; (4) those announcing an intention to depart via a seaport of the United States for Hawaii or insular possessions of the United States, or for foreign countries, except arrivals from Canada intending to return thereto by water; and (5) those announcing an intention to depart across the other land boundary.

These classes were revised in 1945 so that the statistics of arriving aliens at land border ports of entry for 1945–1952 included (1)arriving aliens who came into the United States for 30 days or more; and (2) returning alien residents who had been out of the United States more than 6 months. Arriving aliens who came into the United States for 29 days *or* less were not counted except those certified by public health officials, aliens held for a board of special inquiry, aliens excluded and deported, and aliens in transit who announced an intention to depart across another land boundary, or by sea.

Since 1953, all arriving aliens at land border ports of entry are counted and included except Canadian citizens and British subjects resident in Canada who were admitted for 6 months *or* less, and Mexican citizens who were admitted for 72 hours or less in the United States.

Persons who cross the land borders for brief periods (border crossers) are not included in the immigration and emigration statistics. The Immigration and Naturalization Service publishes statistics on alien and citizen border crossers in the *Annual Report,* however.

Arrivals in and departures from the Philippines were recorded in the port tables for 1910–1924, but were not included in the total immigration data. For 1925–1931, such arrivals and departures were obtained annually from the Bureau of Insular Affairs, War Department, and published in separate tables. The Immigration Service has no records since 1932 of arrivals in, or departures from, the Philippines to foreign countries.

Data on aliens admitted to conterminous United States from insular possessions were compiled from 1908 through 1964. Aliens admitted from the Virgin Islands were first recorded in 1917. The departure of aliens from the mainland to Puerto Rico was first recorded in 1918. Data on aliens from Guam began in 1929; Samoa, in 1932.

Definition of terms. For 1820–1867, immigration totals (compiled by the Department of State) were shown as alien passenger arrivals, but may have included alien passengers who died before arrival, and did include, for 1856–1867, temporary visitors among arriving alien passengers. For the 12-year period, the temporary visitors constituted about 1% percent of the alien passenger arrivals.

For 1868–1891, the Bureau of Statistics immigrant arrival figures (excluding temporary visitors), were reported. Since 1892, official immigration data have been compiled by the Office of Immigration (and its successors) and for 1892–1895 its totals were 7 to 8 percent lower than those for the Bureau of Statistics for that period. The difference is largely attributable to the limitation of the Office of Immigration figures to alien steerage passengers; cabin class passengers were not again included as immigrants until 1904. A further difference was that the Bureau of Statistics figures were for arrivals and those of the Office of Immigration were for admissions.

For 1895–1897, the Office of Immigration readopted arrivals and the figures include the 2,419 aliens debarred in 1895, the 2,799 in 1896, and 1,880 in 1897. In later years, the immigration data were further refined to exclude aliens in transit through the United States (1904), and resident aliens returning from a visit abroad (1906).

In 1906 arriving aliens were divided into two classes: Immigrants, or those who intended to settle in the United States, and nonimmigrants, or admitted aliens who declared an intention not to settle in the United States, and all aliens returning to resume domiciles formerly acquired in the United States.

The official record of emigration began in 1907 and ended in 1957. It was made possible by the Immigration Act of 1907, which required all steamship companies carrying departing aliens to furnish manifests similar to those required for arriving aliens.

For 1908–1932, aliens arriving in or departing from the United States were classified as follows: Arriving aliens with permanent domicile outside the United States who intended to reside permanently in the United States were classed as immigrants; departing aliens with permanent residence in the United States who intended to reside permanently abroad were classed as emigrants; all alien residents making a Temporary trip abroad and all aliens residing abroad making a temporary trip to the United States were classed as nonimmigrants on the inward journey and nonemigrants on the outward. Permanent residence was defined as residence of 1 year or longer. (*Annual Report of the Commissioner General of Immigration, 1908*, p. 6.)

Since 1933, aliens arriving in the United States have been classified as immigrants or nonimmigrants. Immigrants are nonresident aliens admitted to the United States for permanent residence. Until July 1, 1968, they were further classified as quota and nonquota immigrants. Quota immigrants were those subject to the established quotas of Eastern Hemisphere countries and their dependencies. Nonquota immigrants included natives of the Western Hemisphere and their spouses and children, immediate relatives of U.S. citizens, and certain groups of special immigrants. Beginning July 1, 1968, immigrants have been classified as those subject to the numerical limitations of the Eastern Hemisphere, those subject to the numerical limitations of the Western Hemisphere, and those exempt from numerical limitations. Those that are exempt include immediate relatives (parents, spouses, and children) of US. citizens and various classes of special immigrants.

Nonimmigrants are nonresident aliens admitted to the United States for a temporary period. Included in this group are visitors for business and pleasure, students and their spouses and children, temporary workers and trainees and their spouses and children, foreign government officials, exchange visitors and their spouses and children, international representatives, treaty traders and investors, representatives of foreign information media, fiances(ees) of U.S. citizens and their children, intracompany transferees and their spouses and children, NATO officials, aliens in transit, and, for statistical purposes, permanent resident aliens returning after short trips abroad. Excluded are border crossers, crewmen, and insular travelers.

Data on emigrants have not been kept since 1957. Emigrants were aliens who resided in the United States for a year or longer and who left for a Permanent residence abroad. Nonemigrants were resident aliens of the United States who left the United States for a temporary period abroad, or nonresident aliens of the United States who were in the United States for less than a year who were returning to their permanent residence abroad. Since 1957 data have been kept only on aliens departing. They include all aliens departing by sea or air except for direct departures to Canada.

The old definitions of immigrant, emigrant, nonimmigrant, and nonemigrant somewhat impaired the reliability of net immigration figures. While immigrants were admitted for permanent residence, they could depart prior to residence of 1 year, in which case they were counted as immigrants on arrival and nonemigrants on departure. Persons coming in temporarily, however, as nonimmigrants who failed to leave within a year would have been counted as emigrants on departure.

C 89-119. Immigrants, **by country, 1820-1970.**

Source: 1820–1932, U.S. Immigration and Naturalization Service, unpublished data, and U.S. Bureau of Immigration, *Annual Report of the Commissioner General of Immigration*, as follows: 1820–1926 *Report* for *1926*, pp. 170–178; 1927–1931, *Report* for *1931*, pp. 222–223; 1932, *Report* for *1932*, pp. 120–125; 1933–1957, **U.S.** Immigration and Naturalization Service, unpublished data; 1958–1970, *Annual Report of the Immigration and Naturalization Service*, annual issues.

Prior to 1906, data cover countries from which the aliens came; thereafter, countries of last permanent residence. Owing to changes in the list of countries separately reported and to changes in boundaries, data for certain countries are not comparable throughout. Under the provisions of the Immigration and Nationality Act, subquotas of 100 each were established for colonies or dependencies, to be charged against the quota of the mother country. Because of these provisions, statistics were compiled, between January 1953 and July 1968, for each colony or dependency having a subquota. Under the Act of October 3, 1965, colonies and dependencies of foreign states are alloted 200 visa numbers each, chargeable to the mother country.

The principal changes in reporting immigrants by country since 1820 are shown in the detailed listing below.

See also general note for series C 89–157.

C 90-101. Immigration **from Europe, 1820-1970.**

Source: See source for series C 89–119.

Since 1820, territorial transfers in Europe have, to a certain extent, impaired the comparability of immigration statistics from that continent. Data for Austria–Hungary were not reported until 1861. Austria and Hungary have been reported separately since 1905. For 1938–1945, Austria is included with Germany. Bulgaria, Serbia, and Montenegro were first reported in 1899. In 1920, Bulgaria was reported separately, as was the Kingdom of Serbs, Croats, and Slovenes (identified as Yugoslavia since 1922). Prior to 1925, Northern Ireland was included with Ireland (Eire). The figures for Norway and Sweden were combined from 1820–1868; since 1869, each country has been reported separately. Poland was recorded as a separate country for 1820–1898 and since 1920. During 1899–1919, Poland was included with Austria-Hungary, Germany, and Russia. There is no record of immigration from Romania prior to 1880.

International transfers in territory following World War I resulted in the establishment of several countries. In 1920, Czechoslovakia, Finland, Poland, and the Kingdom of Serbs, Croats, and Slovenes (designated as Yugoslavia in 1922) were added to the immigration lists; in 1924, Albania, Estonia, Latvia, and Lithuania were added; in 1925, the Free City of Danzig and Luxembourg were added.

The Immigration Act of 1924, which established quotas for all independent countries in Europe, Asia, Africa, and the Pacific, effected a further change in the immigration lists of countries. This change, however, was not fully felt until 1931. In that year, Andorra, Iceland, Liechtenstein, Monaco, and San Marino were added to the European countries, and the Russian Empire was classified into European Russia (designated as U.S.S.R. in Europe from 1947 through 1963) and Siberia, or Asiatic Russia. Since 1964, all the U.S.S.R. has been included in Europe. The principal effect of the 1924 Act,

however, was in the extension of the lists of Asian, African, and Western Hemisphere countries.

In 1950, Bessarabia and the northern portion of Bukovina were included in the U.S.S.R. instead of in Romania. The Dodecanese Islands were included in Greece instead of Italy. The Free Territory of Trieste, formerly a part of Italy and Yugoslavia, was established as an independent country until 1959, when it again became part of Italy and Yugoslavia in immigration statistics.

C 102–109. Immigration from Asia, 1820–1970.

Source: See source for series C 89–119.

China and India are the only countries in Asia for which the records of immigration to the United States date back to 1820. A few immigrants from Japan were recorded in 1861, 1866, and 1867, but complete records for Japan begin with 1869. Figures for Turkey in Asia are available since 1869. Data on some immigration from Arabia are recorded for 1876–1895; from Armenia for 1874–1895; and from Persia for 1871–1895. For 1896–1923, immigration from Asia included only China, India, Japan, Turkey in Asia, and "other Asia." In 1924, Syria was added, and in 1925, Armenia, Palestine, and Persia (Iran) were added to the lists of Asian countries. Since 1934, Armenia has been included in Russia. In 1931, Siberia, or Asiatic Russia, was separated from European Russia, and Iraq and Siam (Thailand) were added to the lists. Since 1964, all the U.S.S.R. has been included in Europe.

In 1945, the classification of country in the country-of-birth statistics (on which the Quota Law was based) was adopted for the immigration statistics. This change resulted in the addition to the immigration lists of Afghanistan, Arabian Peninsula, Bhutan, Muscat, Nepal, Saudi Arabia, and Asiatic colonies, dependencies, and protectorates of European countries. Since 1948, the following countries have been added to the immigration lists: (1948) Burma, Ceylon, Jordan, Korea, and Pakistan; (1949) Israel (formerly included with Palestine), Lebanon (formerly included with Syria), and Yemen; (1950) Indonesia; (1952) Bonin Volcano Islands, Ryukyu Islands, Cambodia, Laos, and Vietnam; (1957) Formosa; (1961) Cyprus; (1963) Kuwait; (1964) Malaysia; (1967) Singapore.

C 110–114. Immigration from America, 1820–1970.

Source: See source for series C 89–119.

Prior to 1920, Canada and Newfoundland were recorded under country of last permanent residence as British North America. For 1920–1924, combined figures are available for Canada and Newfoundland; for 1925–1948, each was reported separately. Since 1950, Newfoundland has been included in Canada. Inspection of Canadians and Mexicans was first authorized by the Act of 1907. The first complete year for which all immigration via the land borders was recorded is, therefore, 1908.

Immigration from Mexico has been recorded for 1820–1885 and for 1894 to the present. Immigration statistics for the West Indies have been available since 1820. For 1820–1860, there was no classification of the West Indies, by country. For 1861–1898, some immigration was recorded from Antigua (1873–1895), Bahamas (1871–1895), Barbados (1869–1895), Bermuda (1861–1895), Cuba (1869–1898), Curacao (1873–1895), Haiti (1869–1895), Jamaica (1869–1895), Puerto Rico (1869–1895), Saint Croix (1871–1895), Saint Thomas (1872–1895), and Trinidad (1874–1895). For 1899–1924, there again was no classification by country of immigration from the West Indies. Immigration from Cuba has been separately recorded since 1925; from the British West Indies, Dominican Republic, Dutch West Indies, French West Indies, and Haiti since 1931; and from Bermuda since 1945. For detailed data, see *Annual Report* of *Commissioner General of Immigration* for each year, 1892–1932. Since January 1958, all countries in the West Indies have been reported.

Immigration from Central America has been recorded since 1820, but not by country during most of that period. Separate statistics are available for 1895–1898 for Guatemala, Honduras, Nicaragua, and El Salvador; and for 1895–1897 for Costa Rica. British Honduras was also enumerated separately for 1874–1910. With the above exceptions, only figures for total immigration were available for Central America until 1925. Immigration has been reported separately from British Honduras since 1925, and from the Canal Zone, Costa Rica, Guatemala, Honduras, Nicaragua, Panama, and El Savador since 1931.

Immigration from South America has also been reported in total since 1820 but, with the following exceptions, not by country until 1925. For 1869–1895, separate enumerations were made for Brazil, Chile, Colombia, Ecuador, Guiana, Peru, and Venezuela; and for 1871–1895 for the Argentine Republic. Separate figures for Brazil have been again available since 1925; and since 1931 for Argentina, Bolivia, British Guiana (since 1967, Guyana), Dutch Guiana (Surinam), French Guiana, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay, and Venezuela.

C 115. Immigration from Africa, 1820–1970.

Source: See source for series C 89–119.

Immigration from Africa has been recorded since 1820, but, with few exceptions, was not classified by country until 1931. There is record of some immigration from Liberia in 1829, 1839, 1844, and 1857–1893; Algeria, 1872–1894; Egypt, 1869–1895; and South Africa, 1869–1895. For 1890–1924, only immigration for continental Africa was reported. Immigration from Ethiopia (Abyssinia), Liberia, Morocco, and Union of South Africa has been recorded since 1931. In 1945, "other Africa" was classified into Cameroons (British Mandate), Cameroons (French Mandate), Ruanda and Urundi (trust territory, Belgium), South-West Africa (Mandate of the Union of South Africa), Tanganyika (trust territory, United Kingdom), Togoland (British Mandate), Togoland (trust territory, France), and colonies, dependencies, *or* protectorates of Belgium, France, Great Britain, Italy, Portugal, and Spain. Many of these countries have since gained their independence.

Since 1945, the following countries have been added: 1953: Libya and Somaliland (Italian administration), and Southern Rhodesia. Eritrea, which was federated with Ethiopia, was included with Ethiopia. 1957: Ghana (composed of British territories, Gold Coast and British Togoland), Sudan, and Tunisia. 1961: Congo, Republic of the Congo, Dahomey, Gabon, Ivory Coast, Malagasy Republic, Republic of Mali, Niger, Nigeria, Republic of Senegal, Somali Republic, and Upper Volta. 1963: Burundi and Rwanda, formerly Ruanda-Urundi. 1967: Botswana and Lesotho.

C 116–118. Immigration from Australasia, 1870–1970.

Source: See source for series C 89–119.

Immigration from Australia was recorded separately in 1822, 1839–1840, and for most of the years 1854–1898. For 1899–1924, a combined total was recorded for Australia, Tasmania, and New Zealand, and, since 1925, Australia has again been reported separately. Separate figures for New Zealand are available for 1870–1890. For 1891–1893, New Zealand was included in "all other countries"; for 1894–1898, in "Pacific Islands, not specified," and for 1899–1924, with Australia and Tasmania. Separate figures for New Zealand have again been available since 1925.

The following countries were added to the immigration lists of the Pacific in 1945: Nauru (British Mandate); Territory of New Guinea including appertaining islands (Australian Mandate); Western Samoa (New Zealand Mandate); Yap and other Pacific Islands under Japanese Mandate; and colonies, dependencies, or protectorates of France, Great Britain, Japan, Netherlands, and Portugal. In 1952, the Pacific Islands (trust territory, U.S. administration) were added. In 1962, Western Samoa gained its independence and, since 1968, Nauru has also been an independent nation. Yap and several of the other islands once under the mandate of Japan are now included in Japan.

C 120–137. Immigrants, by major occupation group, 1820–1970.

Source: U.S. Department of the Treasury, Bureau of Statistics, 1820–1890, *Arrivals of Alien Passengers and Immigrants in the United States, 1820–1890*, pp. 42–49; 1891, *Immigration into the United States Showing Number, Nationality, Sex, Age, Occupation, Destination, ... from 1820–1903*. U.S. Bureau of Immigration 1892–1898, *Annual Report of Commissioner General of Immigration*, annual issues. U.S. Immigration and Naturalization Service, 1899–1944, unpublished data; 1945–1970, *Annual Report of the Immigration and Naturalization Service*, annual issues, and unpublished data.

The major occupation groups for 1820–1898 include the following categories: Professional—occupations which involve a liberal education or its equivalent and mental rather than manual skills; commercial—agents, bankers, hotelkeepers, manufacturers, and merchants and dealers; skilled—occupations requiring special training of a manual rather than mental nature. A "farmer" is one who operates a farm, either for himself or for others; a "farm laborer" is one who works on a farm for the man who operates it. The "no occupation" group includes dependent women and children, other aliens without occupation, and aliens whose occupations were not stated.

Although the data are shown in broad occupation groups, the instructions for compiling statistics specified that the occupation should he described as precisely as possible. For example, civil engineer, stationary engineer, mining engineer, brass polisher, steel polisher, iron molder, wood turner, etc., should be so described, and not entered simply as engineer, polisher, molder, turner, or other indefinite designation.

From 1945 to 1951, the Immigration and Naturalization Service applied the major occupation groups as shown in the *Sixteenth Census of the United States, Alphabetical Index of Occupations and Industries*. It also grouped occupations of immigrants for 1899–1944 (compiled in unpublished records) as closely as possible into the new groups. From 1952 to 1961, occupations were coded and grouped in accordance with the definitions in *U.S. Census of Population: 1950, Alphabetical Index of Occupations and Industries;* beginning with 1962, occupations have been grouped according to the 1960 index.

The occupation figures include all immigrants, those with and without work experience. The "no occupation" group includes housewives, unemployed, retired persons, students, children under 14 years of age, aliens with no occupation, and occupation unknown or not reported.

See also general note for series C 89–157.

C 138, 140–142. Immigrants, by age, 1820–1970.

Source: U.S. Department of the Treasury, Bureau of Statistics, 1820–1897, *Monthly Summary of Commerce and Finance of the U.S.*, No. 12, series 1902–1903, pp. 4358 and 4362; U.S. Bureau of Immigration, 1898–1932, *Annual Report of the Commissioner General of Immigration*, annual issues; U.S. Immigration and Naturalization Service, 1933–1957, unpublished data; 1958–1970, *Annual Report of the Immigration and Naturalization Service*, annual issues, and unpublished data.

Some of the published estimates have been revised because of apparent printing errors in the source.

The age groups used to classify immigrants have changed a number of times since 1820, thereby impairing to a certain extent their comparability. For 1820–1898, the classification was: Under 15 years, 15 to 40, and over 40. In addition, the age of nearly 250,000 immigrants, or 4 percent of the total, for 1820–1866 was not reported.

For 1899–1917, the age classification was: Under 14 years, 14 to 44, and 45 years and over; for 1918–1924: Under 16 years, 16 to 44, and 45 years and over.

Although only three age groups were generally used before 1925, a more detailed classification was used for 1910–1924 for single females: 15 to 19 years, 20 to 24, 25 to 29, and 30 to 34 in 1910; 14 to 21 years, 22 to 29, 30 to 37, and 38 to 44 for 1911–1917; 16 to 21 years, 22 to 29, 30 to 37, and 38 to 44 for 1918–1924.

In 1925 the age classification was enlarged from 3 to 6 groups: Under 16 years, 16 to 21, 22 to 29, 30 to 37, 38 to 44, and 45 years and over. In 1940, it was enlarged to 12 groups, with a lower limit of under 11 years, 5-year age groups until 60, and an upper limit of over 60 years. In 1945, it was further enlarged into 5-year groups, with a lower age limit of under 5 years and an upper open-end limit of 100 years and over. The upper limit has since been changed to 95 and over.

See also general note for series C 89–157.

C 139. Male immigrants, 1820–1970.

Source: Senate Doc. No. 756, 61st Congress, 1820–1910, *Reports of the Immigration Commission*, vol. 3. U.S. Bureau of Immigration, 1911–1931, *Annual Report of the Commissioner General of Immigration*, 1931; 1932, *Annual Report of the Commissioner General of Immigration*, 1932. U.S. Immigration and Naturalization Service, 1933–1939, unpublished data; 1940–1970, *Annual Report of the Immigration and Naturalization Service*, annual issues.

Although the Act of 1819 required that arriving immigrants be recorded by sex, these data were not satisfactorily compiled before 1869. (See Senate Doc. No. 756 cited above.) The earlier reports of the Secretary of State to Congress contain partial data on this subject, and in 1911 the Immigration Commission compiled percentage data to show the approximate sex distribution for 1820–1867. The data are not complete, as in most years sex was not reported for a considerable number of immigrants, but on the whole the percentages may be accepted as fairly representative of the sex distribution in the years considered. For continuity of data throughout the 1820–1970 period, the above mentioned percentages have been applied to the total immigration figures for the years 1820 through 1867 to arrive at an estimate of the number of male immigrants. Data for 1869 through 1970 reflect actual data of immigration by sex.

C 143–157. Annual quota and aliens admitted, by classes, 1925–1970.

Source: US. Immigration and Naturalization Service, *Annual Report of Immigration and Naturalization Service*, annual issues, Presidential Proclamations on quotas, and unpublished data.

For 1925–1929, the annual quota (series C 143) of 164,667 was based on 2 percent of the foreign-born residents in the United States as determined by the 1890 census. The "national origin" formula which determined quotas from 1929 until the Act of October 3, 1965, went into *effect*, provided that the annual quota equal one-sixth of one percent of the number of white inhabitants in the continental United States in 1920, less Western Hemisphere immigrants and their descendants. The annual quota for each nationality was then determined by the same ratio to 150,000 as the number of inhabitants of each nationality living in the continental United States in 1920 to the total inhabitants, although a minimum quota for any nationality was 100. As territorial boundaries changed and new countries were established, slight changes in quotas occurred.

The Act of October 3, 1965, abolished the quota system and in its place set up an annual numerical limitation of 170,000 immigrants from the Eastern Hemisphere, with no more than 20,000 immigrants to come from any one country. From December 1, 1965, through June 30, 1968, countries retained their old quotas, but unused visa numbers from each year went into a general pool of numbers available on a first-come, first-served basis during the next year. On July 1, 1968, the new law and the system of numerical limitations went fully into effect. Also at that time a numerical limitation of 120,000 per year was imposed on Western Hemisphere immigration, which had previously been unrestricted. The Act of October 3, 1965, thereby abolished the "national origins" system and gave persons from every country within each hemisphere an equal chance to immigrate to the United States.

The classes presented in these series are legal classes of admission defined in the Act of 1924 and the Immigration and Nationality Act of 1952 as amended by the Act of October 3, 1965. Returning

resident aliens, who have been counted before as immigrants, are included with nonimmigrants.

In general, statistics on aliens admitted have been derived from manifests or entry documents. Changes in regulations extending documentary waivers for nonimmigrants entering via the Canadian or Mexican border, or from adjacent islands, have impaired comparability of the nonimmigrant statistics.

See also general note for series C 89–157.

C 158-161. Aliens deported, required to depart, and excluded, **1892–1970.**

Source: U.S. Immigration and Naturalization Service, *Annual Report of Immigration and Naturalization Service,* 1967, pp. 46, 50, and 1970, p. 85.

C 159, aliens deported. Undesirable aliens who have violated certain immigration laws may be expelled or deported under formal deportation proceedings. Deportation of alien contract laborers within one year after entry was authorized by the Act of 1888. Deportation statistics, however, have been compiled only since 1892, shortly after enactment of the Act of 1891, which provided for the deportation of all aliens who entered unlawfully. The classes of deportable aliens were extended by subsequent acts and are now defined in the Immigration and Nationality Act of 1952 as amended by the Act of October 3, 1965. The principal deportable classes are criminals (including violators of narcotic laws), immoral classes, mental or physical defectives, public charges, subversives, and those who entered illegally or failed to maintain or comply with the conditions of admission.

C 160, aliens required to depart. Aliens who would be deportable under certain sections of the law may forego formal deportation hearings and depart voluntarily either at their own expense, or if deemed desirable, at the expense of the Government. Statistics on aliens required to depart have been recorded since 1927.

C **161,** aliens excluded. Prior to 1882, various State laws were enacted excluding from admission to the United States undesirable aliens such as paupers, felons, and diseased aliens. The first Chinese exclusion law was passed in 1882. Lunatics, idiots, and persons likely to become public charges were first excluded by the Act of 1882.

Statistics on aliens excluded were first compiled in 1892, shortly after passage of the Act of 1891, which extended the classes of excludable aliens. Subsequent acts, principally the Immigration Act of 1917, and the Immigration and Nationality Act of 1962, extended these classes further. At present, the principal classes excluded are attempted illegal entries, criminals (including violators of narcotic laws), immoral persons, subversive or anarchistic persons, attempted entry without proper documents, mental or physical defectives, stowaways, and those likely to become a public charge.

C **162-167.** Aliens naturalized, by type **of** provision, **1907-1970.**

Source: 1907–1930, U.S. Bureau of Naturalization, *Annual Report of the Commissioner of Naturalization;* 1931–1970, U.S. Immigration and Naturalization Service, *Annual Report of the Immigration and Naturalization Service,* annual issues.

See also general note for series C 168–180.

General naturalization provisions. Since the first naturalization statute of 1790, residence in the United States, good moral character, and an oath to support the Constitution have been required of persons seeking U.S. citizenship. The Act of April 14, 1802, incorporated the requisites of 5 years' residence in the United States, favorable disposition to the happiness of the nation, good moral character, and attachment to the principles of the Constitution. These prerequisites for naturalization are still in basically the same form today.

Married to U.S. citizens. Prior to 1922, married women were ineligible for judicial naturalization during coverture. The Act of September 22, 1922, however, eliminated sex and marital status as factors for eligibility and established a one year residence requirement for a woman who married a U.S. citizen. On May 24, 1934, another act provided similar benefits but extended them to the spouse of a U.S. citizen, woman or man, and set a 3-year residence requirement which has continued into the current statute.

Children of U.S. citizens. Statutes prior to the Act of October 14, 1940, made no provisions for the naturalization of a minor child except under special circumstances. Beginning with the 1940 Act, a child born outside the United States, one or both of whose parents is a U.S. citizen at the time of petitioning, may be naturalized if under the age of 18, if not otherwise disqualified, and if residing permanently in the United States with the citizen parent. No particular period of residence is required and if the child is of "tender years" he may be presumed to be of good moral character and attached to the principles of the Constitution. Children adopted by U.S. citizens before attaining 16 years of age were also first provided for in the 1940 Act and similar legislation was reenacted in the Act of October 3, 1965. The current law requires a specified period of residence, generally 2 years, but adoption does not have to be in the United States as specified in the earlier law.

Military. Prior to 1918, special provisions were not made for persons who had served in the U.S. Armed Forces. The Act of May 9, 1918, and subsequent amendments expiring December 8, 1943, provided for the simplified naturalization of veterans of World War I and prior conflicts. The Act of March 27, 1942, for which the termination date for filing petitions was set on December 31, 1946, gave special benefits to World War II servicemen. The Act of June 1,1948, made permanent the provisions for the expeditious naturalization of persons serving honorably in the U.S. Armed Forces during World Wars I and II. On September 26, 1961, another act amended the above to include those serving in the Korean Conflict occurring between June 25, 1950, and July 1, 1955. The Act of October 24, 1968, added the Vietnam Conflict for a period beginning February 28, 1961, and ending on a date to be fixed by the President.

C 168-180. General note.

Prior to 1906, individual courts kept records of naturalizations, but no national data were compiled. The Act of 1906 required all courts conducting naturalization proceedings to file with a central Federal agency a copy of each declaration of intention and petition of naturalization filed and of each certificate of naturalization issued.

For 1907–1912, naturalization statistics were compiled by the Bureau of Immigration and Naturalization. For 1913–1932, they were compiled by the Bureau of Naturalization. For 1933–1940, they were given in the *Annual Report of the Secretary of Labor* and, for 1941, in the *Annual Report of the Attorney General.* No report was published in 1942. For subsequent years, the statistics appeared in the *Annual Report of the Immigration and Naturalization Service.*

C 168. Declarations filed, **1907-1970.**

Source: 1907–1910, U.S. Department of Labor, *Annual Report of the Secretary of Labor,* 1940, p. 115; 1911–1970, U.S. Immigration and Naturalization Service, *Annual Report of Immigration and Naturalization Service,* annual issues.

See also general note for series C 168–180.

Section 331 of the Nationality Act of 1940 provided that an applicant for naturalization after reaching the age of **18** years must make, under oath, not less than 2 nor more than 7 years prior to his petition for naturalization, a signed declaration of intention to become a citizen. This section contained substantially the requirements of the Basic Naturalization Act of 1906 concerning the declaration of intention. The Immigration and Nationality Act of 1952, which repealed the Nationality Act of 1940, provides that a declaration of intention may be filed, but it is not a prerequisite to naturalization. In a number of States, in order to obtain employment, a license, etc., an alien applicant must prove that he intends to become a citizen. The law permits the filing of a declaration to show such intent.

Prior to 1930, the number of declarations of intention was far in excess of the number of aliens naturalized. This was due mainly to the failure of many aliens to file a petition for naturalization within the prescribed time limit, as well as the denial of a number of petitions for naturalization. In most of the years since 1930 the number of aliens naturalized has exceeded the declarations filed, because of the increasing number of persons who were exempted from the general requirements for a declaration of intention.

Since 1907, a number of laws were passed exempting special classes of persons from the general requirement of a declaration of intention. Most of these laws were codified into the Nationality Act of 1940. Included among such exempted classes were noncitizen spouses of United States citizens; certain former citizens; noncitizens who, because of misinformation, erroneously exercised the rights of citizenship; noncitizens who, at the time of entering the United States, were under 16 years of age; certain noncitizens who served honorably in the United States Armed Forces or on certain vessels; and certain noncitizen children.

C 169. Aliens naturalized, **1907–1970.**

Source: See source for series C 168.

"Aliens naturalized" are aliens upon whom naturalization was conferred in the United States by a naturalization court or outside of the United States by a representative of the Immigration and Naturalization Service. The total number of aliens naturalized includes both civilian and military naturalizations. Statistics on naturalizations do not include repatriations.

Separate statistics on repatriations are compiled by the Immigration and Naturalization Service which also compiles statistics on certificates of derivative citizenship granted and denied, expatriations and certificates of naturalization revoked, and petitions for naturalization denied.

C 170–171. Aliens naturalized, **by** sex, **1923–1970.**

C 172–179. Aliens naturalized, **by** area of former allegiance, **1923–1970.**

Source: U.S. Bureau of Naturalization, 1923–1932, *Annual Report of the Commissioner of Naturalization,* annual issues; U.S. Immigration and Naturalization Service, 1933–1935, unpublished data; 1936–1970, *Annual Report of the Immigration and Naturalization Service,* annual issues.

See also general note for series C 168–180.

"Country of former allegiance or nationality" is the country of which the alien at the time was a citizen or subject. Data on the number of aliens naturalized, by country or region of former allegiance, have been compiled only from 1922. Owing to changes in the list of countries separately reported and to changes in boundaries, data for certain countries are not comparable throughout. The principal changes in reporting since 1923 are shown for individual series below.

C 172, Northwestern Europe. Includes the British Empire, Norway, Sweden, Denmark, Netherlands, Belgium, Luxembourg, Switzerland, France, and, beginning 1948, Iceland. Beginning 1948, Ireland has been reported separately. Australia has been reported separately from 1951, and included in "All other" (series C 179). For earlier years, Ireland and Australia are included under the British Empire. See text for series C 176, C 177, and C 179 for former British territories.

C 173, Central Europe. Includes Germany, Poland, Czechoslovakia, Austria, Hungary, and Yugoslavia. For 1938–1947, Austria was included with Germany.

C 174, Eastern Europe. Includes the Union of Soviet Socialist Republics, Latvia, Estonia, Lithuania, Finland, Romania, Bulgaria, and Turkey. For 1923–1927, Lithuania comprised portions of Russia and Germany. European and Asiatic Turkey are included in Eastern Europe.

C 175, Southern Europe. Includes Greece, Italy, Spain, Portugal, and for 1929–1970, "Other Europe," which comprises Albania, the Free City of Danzig, Liechtenstein, San Marino, Monaco, Andorra, and for the years 1950–1959, Trieste. For 1923–1928, "Other Europe" was recorded under the "miscellaneous" group of countries and is included with "All other" (C 179).

C 176, Asia. The Asian countries reported separately and the beginning dates are shown below:

Afghanistan (1929); Arabian Peninsula (1943); Bhutan (1945); Burma (1949); Cambodia (1959); Ceylon (1948); China (1932); Cyprus (1961); India (1948, British Empire formerly); Indonesia (1950); Iran (1929); Iraq (1929); Israel (1950, Palestine formerly); Japan (1932); Jordan (1948, formerly called Trans-Jordan and included with Palestine prior to 1948); Korea (1948, Japan formerly); Kuwait (1962); Laos (1960); Lebanon (1950, included in Syria formerly); Malaysia (1963); Maldive Republic (1970); Muscat and Oman (1945); Nepal (1945); Pakistan (1948, included in British Empire formerly); Palestine (reported separately 1929–1944 and since 1948; included in British Empire 1945–1947); Philippines (1929); Saudi Arabia (1945); Singapore (1967); Southern Yemen (1969); Syria (reported separately 1928–1944, 1948–1958, and 1962–1970; included in France, 1944–1947 and in United Arab Republic, 1959–1961; Thailand (Siam, 1944); Vietnam (1952); Yemen (1950); and Tiawan (Formosa, 1957).

Until 1953, racial restrictions upon naturalization limited the naturalization of aliens who were citizens or subjects of countries located in Asia. (See text for series C 180.)

C 178, other America. Includes Mexico, the West Indies, Central and South America. Figures for Mexico date from 1924; for the West Indies (Cuba, Dominican Republic, and Haiti separately) from 1929. For 1924–1928, the figures for Central and South America were combined. Separate figures have been compiled for independent countries in Central and South America beginning with 1929, except in 1933.

C 179, all other. Includes "miscellaneous" countries 1923–1928; repatriated Americans, 1924–1934; "stateless" nationals from 1945; Ethiopia from 1929; Liberia from 1929; and countries which were former territories. Former territories and the beginning dates of separate report are shown below:

Formerly French territories: Libya (1953); Tunisia (1937); Sudan (1957); Morocco (1958); Guinea (1960); Central African Republic, Chad, Congo, Dahomey, Gabon, Ivory Coast, Malagasy Republic, Republic of Mali, Mauritania, Niger, Republic of Senegal, Togo, and Upper Volta (1961); Algeria and Cameroon (1963). Formerly British Territories: Egypt, included in British Empire, 1945–1947, reported separately 1929–1944 and since 1948; South West Africa (1952); Southern Rhodesia (1953); Union of South Africa (1948); Australia (1951); Nauru (1952); New Guinea (1962); New Zealand (1952); and Western Samoa (1952). Ghana (1959), Nigeria and Sierra Leone (1961); Tanganyika (1962); Kenya (1964), Malawi, Uganda, and Zanzibar (1965); Zambia (1966); Gambia (1967); Tanzania (1968), Botswana and Lesotho (1969), Mauritius and Swaziland (1970). Formerly Belgian territories: Republic of the Congo (1961), Burundi and Rwanda (1964). Formerly Italian Administration: Somaliland (1953; Somali Republic as of

1961). Formerly international administration: Tangier (1953). Separate figures are available for the following United States possessions: American Samoa, Canal Zone, Puerto Rico, Virgin Islands, and Wake and Midway Islands (1945–1951 and since 1955); Hawaii (1955–1959); Guam (1944–1951, and since 1955); Bonin Islands (1962–1968); Christmas Islands (since 1964); the Ryukyu Islands (since 1960); and Swains Island (since 1962).

C 180. Petitions denied, **1907–1970.**

Source: 1907–1921, U.S. Bureau of Naturalization, *Report of Commissioner of Naturalization,* as follows: 1907–1917, *Report* for 1917, p. 5; 1918–1919, *Report* for 1919, p. 4; 1920, *Report* for 1920, pp. 5–6; 1921–1957, U.S. Immigration and Naturalization Service, *Annual Report of Immigration and Naturalization Service,* annual issues.

See also general note for series C 168–180.

Statistics on petitions denied have been compiled since 1907. The Basic Naturalization Act of 1906 and subsequent naturalization laws specified the eligibility requirements for naturalization. Petitions for naturalization of aliens who fail to meet the prerequisites for naturalization may be denied by the courts at the final naturalization hearing. Included among the reasons for denial are lack of knowledge and understanding of history, principles, and form of government of the United States, failure to establish good moral character, lack of attachment to the Constitution of the United States, inability to speak (read, write) the English language, failure to establish lawful admission to the United States or to meet residence requirements, etc.

In the early laws the right to become naturalized was limited to white persons, and petitions of persons of ineligible races were denied. Gradually such restrictions were removed with respect to Negroes, Filipinos, races indigenous to North and South America and adjacent islands, Chinese, and Guamanians. In 1952, the Immigration and Nationality Act removed all racial restrictions to naturalization.

C 181–194. Citizenship status of the population, **1890–1970.**

Source: U.S. Bureau of the Census. 1890–1940, total, native, and total foreign-born population, and 1930–1940, citizenship status of foreign born and persons 21 years old and over, Sixteenth Census Reports, *Population,* vol. 11, part 1; 1890–1920, data on persons 21 years old and over, and 1920, citizenship status of foreign born, Fifteenth Census Reports, *Population,* vol. 11; 1950, *U.S. Census of Population: 1950,* vol. 11, part 1; 1960, *U.S. Census of Population: 1960,* vol. I, part 1; 1970, *U.S. Census of Population: 1970,* vol. II, *Subject Reports.*

Citizenship. Information on citizenship was used to classify the population into two major categories, citizens and aliens. Citizens are further classified as native or naturalized. "Native" includes all persons born in the United States, Puerto Rico, the Canal Zone, Guam, American Samoa, or the Virgin Islands and persons born abroad of American parents or at sea. It was assumed that all natives were citizens. See also text for series A 105–118.

In 1970, when information on citizenship was missing, it was assigned on the basis of related information.

These statistics relate to the citizenship status of the population at the date of the specified decennial census.

C 195–227. Native population of foreign or mixed parentage, by country of origin of parents, **1900–1970.**

Source: U.S. Bureau of the Census. 1900–1940, Sixteenth Census Reports, *Population, Country of Origin of Foreign Stock;* 1950, *U.S. Census of Population: 1950,* vol. IV, Special Reports, *Nativity and Parentage;* 1960, *U.S. Census of Population: 1960,* vol. I, part 1; 1970, *U.S. Census of Population: 1970,* vol. 11, *Subject Reports.*

The category "native" comprises persons born in the United States, in the Commonwealth of Puerto Rico, in an outlying area of the United States, or at sea. Also included in this category is the small number of persons who, although they were born in a foreign country, have at least one native American parent. When information on place of birth was missing, nativity was assigned on the basis of related information. In previous censuses, persons for whom nativity was not reported were generally classified as native. The rules for determining the nativity of parents are generally the same as those for determining the nativity of the person himself.

Parentage. Information on birthplace of parents is used to classify the native population into two categories: native of native parentage and native of foreign or mixed parentage. The category "native of native parentage" comprises native persons with both parents born in the United States. The category "native of foreign or mixed parentage" includes native persons with one or both parents foreign born.

The definition of country of birth of parents is similar to that used in series C 228–295, below, with one important exception. The classification by country of birth of parents for 1930 and later years is made on the basis of boundaries existing at the date of the specified decennial census. This is the same procedure used for all of the years in series C 228–295. However, the 1920 data on country of birth of parents shown in this series are based on pre-World War I boundaries because of the difficulty of obtaining correct replies on the basis of postwar boundaries for parents of persons enumerated.

See also text for series A 91–104, A 105–118, A 119–134, and A 135–142.

C **228–295.** Foreign-born population, by country **of** birth, **1850–1970.**

Source: U.S. Bureau of the Census. 1850–1930, total foreign born, Fifteenth Census Reports, *Population,* vol. II, p. 233; 1910–1940, foreign-born white, Sixteenth Census Reports, *Population,* vol. II, part 1, p. 43; 1950, *U.S. Census of Population: 1950,* vol. IV, *Special Reports, Nativity and Parentage,* p. 3A-71 and vol. IV, *Special Reports, Nonwhite Population by Race,* p. 3B-82, and unpublished data; 1960, *U.S. Census of Population: 1960,* vol. I, part 1; 1970, *U.S. Census of Population: 1970,* vol. II, *Subject Reports.*

The foreign born population comprises all persons born outside the United States, Puerto Rico, or an outlying area of the United States, except those persons with at least one American parent. Persons born in any of the outlying areas, and American citizens born abroad or at sea, are regarded as native.

The statistics on country of birth are generally based on the political boundaries of foreign nations existing at the date of the specified decennial census. Because of boundary changes following World War I and World War II, accurate comparisons over the entire period, 1850–1950, can be made for relatively few countries. These countries include England, Scotland, Wales, Norway, Sweden, Netherlands, Switzerland, Spain, Portugal, Canada (total of Canada-French, Canada-other, and Newfoundland), and Mexico. For several other countries, as for example, Italy, France, and Belgium, the figures are slightly affected by boundary changes; but these changes have not been so great as to destroy entirely the value of comparative figures. The boundaries of other countries, as for example, U.S.S.R., Austria, Hungary, Romania, and Greece, have been so changed that comparisons over time are subject to a large margin of error.

Statistics on country of birth of the foreign born have generally been restricted to those countries which had at the time of the census a separate political entity. For 1860–1900, however, an exception was made in the case of Poland. Although Poland was not restored to its original status as an independent country until the end of World War I, its historical position was such that Polish immigrants generally regarded Poland as their country of birth regardless of the political sovereignty over their birthplace. For 1860–1890, persons reported as born in Poland were so tabulated without qualification. In the census of 1900, an attempt was made to distinguish Austrian, German, and Russian Poland, and separate statistics for each were presented. In the census of 1910, persons reported as born in Poland

were assigned either to Russia, Germany, or Austria. The figures for 1910, however, have been adjusted on the basis of mother tongue data, to conform as nearly as possible to the conditions in 1930.

Since World War I, the greatest difficulties encountered in the country-of-birth statistics have been the classification of persons born in the former Austro-Hungarian Empire. Many persons born within the prewar boundaries of this Empire could not or did not give the census enumerator the information needed for the determination of their country of birth on the basis of postwar geography. It is therefore quite possible that some persons were assigned to Austria who were really born within the present areas of either Czechoslovakia or Yugoslavia, and that persons were assigned to Hungary who were born within the present areas of Romania or Yugoslavia. Similarly, it is possible that some persons born in Latvia, Estonia, or Lithuania were assigned to Russia. Persons for whom Austria-Hungary was reported in the 1950 census were allocated on the basis of surname to the various countries created out of the territory of the old empire after World War I. Even with this procedure, however, there appears to be some indication that Austria and Hungary are overreported at the expense of Yugoslavia and Czechoslovakia. In 1950 the situation was further complicated by the fact that, although there were extensive de facto boundary changes as a result of World War 11, only a small number of these changes were officially recognized by the United States at that time.

Since 1950, persons have been allocated to a specific country based on mother tongue data.

See also text for series A 91–104 and A 105–118.

C 296–301. Passenger arrivals and departures, **1908–1970.**

Source: U.S. Bureau of Immigration, 1908–1930, *Annual Report of the Commissioner General of Immigration.* U.S. Immigration and Naturalization Service, 1931–1949, *Report of Passenger Travel Between the United States and Foreign Countries,* annual issues; 1950–1970, *Annual Report of the Immigration and Naturalization Service,* annual issues.

Statistics on passenger travel are obtained from passenger manifests or lists required by law to be prepared by carriers for vessels and aircraft traveling between the United States and foreign countries. Arrival manifests were first required under the Act of 1819, while similar manifests of departing passengers were first required under the Act of 1907.

Prior to 1908, statistical information on passenger travel is incomplete. From 1820 through 1856, reports showed the total number of alien passengers arrived. During the years 1857 through 1867, data reflected the arrivals of immigrants as well as all alien passenger arrivals. Beginning in 1868, the data related to immigrant arrivals only, a practice that continued until 1906, when alien arrivals were classified into two groups: immigrants and nonimmigrants. No record of the movement of U.S. citizen passengers was made before 1908.

Data relating to the inward and outward movement of passengers became complete in 1908, when, as the result of the Act of 1907, departure records were first compiled. U.S. citizen passengers were also reported for the first time during that year.

C 302–331. Passengers arriving and departing by area of embarkation or debarkalion, flag of carrier, and mode of travel, **1931–1970.**

Source: U.S. Immigration and Naturalization Service, 1931–1949, *Report of Passenger Travel Between the United States and Foreign Countries,* annual issues; 1950–1970, *Annual Report of the Immigration and Naturalization Service,* annual issues.

Detailed statistics relating to the inward and outward movement of passengers were first reported in 1931. These data have, since their inception, been derived from passenger manifests or lists required by law of international carriers arriving in and departing from the United States.

Country of embarkation is the foreign country where the passenger boards the vessel or aircraft which brings him to the United States; country of debarkation is the foreign country where the passenger disembarks from the vessel or aircraft which he boarded in a U.S. port. The origin or final destination of the passenger is not reported. For example, a passenger proceeding from Frankfurt to Paris, where he boards a plane for New York, is counted as arrived in New York from France. Flag of carrier means the nationality of the carrier; cruise travel denotes movement of passengers who embark on a carrier at a U.S. port for a round trip cruise to foreign territory and return on the same carrier. Cruise travel is counted for both inbound and outbound passengers.

More Recent Data for *Historical Statistics* Series

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States,* beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract,* see Appendix I in the *Abstract.*

– Represents zero.

[1] For 1820–1867 excludes returning citizens: therefore, for those years, does not agree with series C 120 and C 138.

[2] Comprises Eire and Northern Ireland.

[3] Comprises Norway, Sweden, Denmark, and Iceland.

[4] Comprises Netherlands, Belgium, Luxembourg, Switzerland, and France.

[5] Includes Austria 1938 to 1945.

[6] Comprises Czechoslovakia (since 1920), Yugoslavia (since 1920), Hungary (since 1861), and Austria (since 1861, except for the years 1938–1945, when Austria was included with Germany).

[7] Comprises U.S.S.R. (excluding Asian U.S.S.R. between 1931 and 1963, Latvia, Estonia, Lithuania, and Finland).

[8] Comprises Romania, Bulgaria, and Turkey in Europe.

[9] Comprises Spain, Portugal, Greece, and other Europe, not elsewhere classified.

[10] Between 1899 and 1919, included with Austria-Hungary, Germany, and Russia.

Series C 89-119. Immigrants, by Country: 1820 *to* 1970—Con.

For years ending June 30, except: 1820–1831 and 1844–1849, years ending Sept. 30; 1833–1842 and 1851–1867, years ending Dec. 31; 1832 covers 15 months ending Dec. 31; 1843, 9 months ending Sept. 30; 1850, 15 months ending Dec. 31; 1868, 6 months ending June 30]

[1] For 1820–1867, figures include returning citizens: for 1820-1866, figures include immigrants not shown separately, whose age was not reported.

[2] For 1940–1944, figures in series C 141 include, and those in series C 142 exclude immigrants 45 years old.

[3] For 1820-1867, data by sex are available only by percentages. These percentages have been applied to the total number of immigrants to estimate the number of males during those years.

[4] Not reported.

[5] 6 months ending June 30.

[6] 3 months ending December 31.

[7] 9 months ending September 30.

Series C 143–157. Annual Quota and Aliens Admitted, by Classes: 1925 to 1970

[For years ending June 30]

[1] Represents quota immigrants through June 30, 1968; see text for series C 143–157. Effective July 1, 1968, natives of the Eastern Hemisphere became subject to an annual numerical limitation of 170,000.

Spouses and children of U.S. citizens; beginning 1966, data also include parents of adult U.S. citizens.

[3] Data include Cuban refugees adjusting their status and the spouses and children of natives of Western Hemisphere countries. Beginning July 1, 1968, natives of Western Hemisphere countries and their spouses and children became subject to an annual numerical limitation of 120,000.

[4] Figures are not comparable because of changes in documentary requirements. Returning resident aliens who have once been counted as immigrants are included with nonimmigrants.

[5] The Act of October 3, 1965, abolished the quota system as of July 1, 1968, and in its place set up an annual limitation of 170,000 on immigration from the Eastern Hemisphere and 120,000 from the Western Hemisphere.

[6] Does not agree with source; adjusted to conform to definitions used in later years.

[1] See text for list of countries.
[2] Data for 1943–1947 and 1954–1956 include naturalizations in various theaters of war or areas occupied by U.S. Forces.
[3] Included in Northwestern Europe as part of British Empire.
[4] Data are from unpublished data of the Immigration and Naturalization Service and do not agree with source quoted. Source excludes Armed Forces overseas whereas the data shown here include them.
[5] Included in "All other."
[6] Includes data for both male and female for the first quarter of the Year when sexes were not reported separately.
[7] September 27, 1906, to June 30, 1907.

Series C 181–194. Citizenship Status of the Population: 1890 to 1970

[Prior to 1920, the citizenship inquiry of the Population Census was restricted to males 21 years old and over. 1970 figures based on 5-percent sample, 1960 on 25-percent, and 1950 on 20-percent; therefore differ from series for 1890–1940 based on complete count]

[1] Based on 15-percent sample.

[2] Based on 25-percent sample.

[3] Foreign-born white based on 20-percent sample; total foreign born, on complete count.

[4] Listed as Holland prior to 1910.

[5] Persons reported in 1910 as of Polish mother tongue born in Austria, Germany, and U.S.S.R. have been deducted from their respective countries and combined as Poland.

[6] White foreign born for 1920–1950, Armenia included with "Other Asia"; beginning 1960, total and white foreign born with **U.S.S.R.**

[7] 1850–1900, Turkey in Asia included with Turkey in Europe; beginning 1950, Turkey in Europe included with Turkey in Asia.

[8] 1910, Albania included with Turkey in Europe: 1930 and 1940, with "Other Europe."

[9] Includes countries for which figures are not shown separately.

[10] Includes persons born in Serbia and Montenegro, which became part of Yugoslavia in 1918.

[11] Palestine included with "Other Asia."

[12] Newfoundland included with Canada prior to 1910.

[13] Excludes U.S. outlying areas.

[14] Includes New Zealand and Trust Territories of the Pacific Islands, but excludes outlying areas of the U.S.

[15] There were 11,656,641 total foreign born persons in 1940; data by country of birth are not available.

Series C 296–301. Passenger Arrivals and Departures: 1908 to 1970

[For years ending June 30. Excludes travel over international land borders, crewmen, military personnel, and travelers between the United States and its outlying areas]

Year	Arrivals			Departures			Year	Arrivals			Departures

[1] Philippines included with Oceania prior to 1950, with Asia thereafter; prior to 1935, the Philippines was a U.S. possession and, therefore, was not included in the total for Oceania. [2] Includes Newfoundland; Greenland not included prior to 1943. [3] Mexico is not reported separately prior to 1942; figures prior to 1942 are for "Other North America." [4] Data on cruise travel not available prior to 1959.

Chapter D

Labor

Labor Force (Series D 1-682)

D 1–74. General note.

The conceptual structure and techniques for measurement of current labor force data were developed during the late 1930's by the Work Projects Administration (see John N. Webb, "Concepts Used in Unemployment Surveys," *Journal of the American Statistical Association*, March 1939). However, prior to 1940, especially during the 1930's, the economically active sector was differentiated on the basis of its ability and willingness to work. Thus, most surveys during the 1930's counted as unemployed those persons not working but "willing and able to work." Willingness and ability, however, turned out to be extremely subjective in practice, and since these concepts were dependent on the attitudes of the persons involved, it was difficult to compile data on a comparable basis from place to place and from time to time.

The estimates shown here, prior to 1940, were prepared on as comparable a basis as possible with the concepts used since 1940. For the techniques used in preparing these data, see their source. In contrast, the decennial census data shown here are not directly comparable with annual data because of differences in collection techniques, time reference, and other factors.

For another set of labor force estimates, 1890–1950, see Clarence D. Long, *The Labor Force Under Changing Income and Employment*, National Bureau of Economic Research, New York, 1958, appendix tables A-4, A-6, and A-20.

The concepts and procedures used since 1940 are based principally upon an individual's actual activity, that is, whether he was working, looking for work, or doing something else during the time reference of the survey. Instead of questions about a person's attitudes with respect to his labor market status (e.g., "Are you able to work?" or "Are you willing to work?" or "Do you want work?"), the present concept makes labor market participation depend on the more overt test of working or actively seeking work.

Current labor force data are collected for the week containing the 12th of each month for the Bureau of Labor Statistics by the Bureau of the Census as a part of the latter's Current Population Survey. The Survey is based on a scientifically designed sample of households in 461 areas (1966–1970), with coverage in every State and the District of Columbia. From May 1956 through December 1966, the sample covered 330 areas, all of which were continued in the new and expanded sample. From January 1954 through April 1956, the sample covered 230 areas and, prior to 1954, the interviewed households were concentrated in 68 sample areas. The number of households interviewed totaled about 35,000 from May 1956 until January 1967, when it was raised to about 47,000. Before May 1956, a total of about 21,000 household interviews were conducted monthly.

The household interview method (population approach) involves direct enumeration and interrogation of individuals to obtain information on employment activity from workers or members of workers' households. This approach encompasses direct enumeration of all employed and unemployed persons including the self-employed, unpaid family workers, domestic servants, and others who do not ordinarily appear on the payrolls of any establishment. For a more detailed description of the concepts, techniques, estimation procedures, and adequacy and reliability of these data, see Bureau of the Census, *Current Population Reports*, series P-23, No. 22.

Labor force data have also been collected in the decennial censuses of population. The sample size for labor force data has varied from census to census (e.g., 20-percent sample in 1970, 25-percent sample in 1960). Also, the concepts have changed over time in a manner corresponding to the Current Population Survey. (See the Decennial Census reports cited for series D 11–25.)

In the surveys and censuses conducted by the Bureau of the Census, persons are currently classified with regard to employment status by the following criteria.

Employed persons comprise: (a) All those who, during the survey week, worked at all as paid employees, in their own business or profession or on their own farm, or who worked 15 hours or more as unpaid workers in an enterprise operated by a family member; and (b) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or personal reasons, whether or not they were paid by their employers for the time off, and whether or not they were seeking other jobs.

Each employed person is counted only once. Those who hold more than one job are counted in the job at which they worked the greatest number of hours during the survey week. Included are employed citizens of foreign countries, temporarily in the United States, but not living on the premises of an Embassy. Excluded are persons whose only activity consisted of work around the house (such as own home housework and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed persons comprise all persons who did not work during the survey week, who made specific efforts to find a job within the past 4 weeks, and who were available for work during the survey week except for temporary illness. Also included as unemployed are those who did not work at all, were available for work, and (a) were waiting to be called back to a job from which they had been laid off; (b) were waiting to report to a new wage or salary job within 30 days.

The *civilian labor force* (persons 14 years old and over through 1966 and to persons 16 years old and over thereafter) is the sum of the employed and the unemployed. Data on the size of the Armed Forces (except for decennial data) is obtained from the Defense Department and added to the civilian labor force to provide the total labor force figures.

Persons not in the labor force include all persons 14 years old and over (or 16 years old and over) not classified as employed, unemployed, or in the Armed Forces.

The foregoing criteria or concepts of measuring employment and unemployment include several revisions made in January 1967 by the President's Committee to Appraise Employment and Unemployment Statistics. The principal revisions are as follows:

a. A specific jobseeking activity within the past 4 weeks must be reported in order to have a person counted as unemployed. Previously, the household interview questionnaire was ambiguous as to the time period for jobseeking, and there was no specific question concerning methods of seeking work.

b. A person must be currently available for work in order to be counted as unemployed. This revision in concept primarily affects the classification of students, who, for example, begin to look for work in the spring when they may not be available until June. They were previously counted as unemployed but are now classified as not in the labor force.

c. Persons with a job are classified as employed, even though they were absent from their jobs in the survey week and were looking for other jobs. Previously, persons absent from their jobs because of strikes, bad weather, etc., who were looking for other jobs were classified as unemployed.

d. The new definition of unemployment excludes those who would have been looking for work except for the belief that no work was available (theoretically counted in the past, but without explicit questions).

Historical data have not been revised to take account of these changes because the differences between the old and the new series are relatively small. For most analytical purposes, the data may be regarded as reasonably comparable. The table below presents comparisons for employment status in 1966, by sex and age. Additional tables comparing the published figures for 1966 on an annual average basis with the estimates derived from the new definitions and procedures appear in Bureau of Labor Statistics *Employment and Earnings and Monthly Report on the Labor Force,* Feb. 1967.

Item	*New definitions*	*Old definitions*
TOTAL, 16 YEARS AND OVER		
Civilian labor force	75,715	75,770
Employed	72,939	72,895
Agriculture	3,904	3,979
Nonagricultural industries	69,035	68,916
Unemployed	2,776	2,875
Not in labor force	52,343	52,288
MEN, 20 YEARS AND OVER		
Civilian labor force	44,637	44,786
Employed	43,650	43,667
Agriculture	2,901	2,894
Nonagricultural industries	40,750	40,773
Unemployed	987	1,119
Not in labor force	8,967	8,818
WOMEN, 20 YEARS AND OVER		
Civilian labor force	24,512	24,427
Employed	23,493	23,507
Agriculture	626	675
Nonagricultural industries	22,867	22,832
Unemployed	1,019	919
Not in labor force	36,348	36,434
BOTH SEXES, 16 TO 19 YEARS		
Civilian labor force	6,565	6,557
Employed	5,795	5,721
Agriculture	377	410
Nonagricultural industries	5,418	5,310
Unemployed	770	836
Not in labor force	7,029	7,036

D 1–10. Labor force and its components, 1900–1947.

Source: Stanley Lebergott, *Manpower in Economic Growth: The American Record Since 1800,* table A-3. (Copyright 1964; used with permission of McGraw-Hill Book Co., New York.)

Lebergott's estimates are designed to be comparable with those of the Current Population Survey. That survey, conducted by the Census Bureau, with its labor-force data presented by the Bureau of Labor Statistics (BLS) provides the continuing official source of reliable data on these subjects. Hence, Lebergott seeks to link to the levels it provides for the years since 1940, when it began. However, the Survey estimates are not wholly consistent with the decennial census levels for 1940. Lebergott's estimates, in consequence, will be at variance with studies tied to decennial census figures. Because the Survey estimates are not consistent with the farm-employment series of the Department of Agriculture, nor with the employees in nonagricultural establishment series of the Department of Labor, Lebergott's series will also not be consistent with them.

See source pp. 355–420. Lebergott's methods may be briefly described as follows: Preliminary annual labor force and employment estimates were derived by interpolating between detailed worker rates in the census years, and applying the resultant series to unpublished census estimates of population annually from 1900 to 1930. Special adjustments were made for labor force variation in World War I, and for immigration effects between 1900 and 1914. Tests of nonlinearity in the 1930's were made.

For 1900, 1910, 1920, and 1930, Lebergott computed worker rates separately for males and females in each of three nativity groups—native white, foreign-born white, and Negro—and within each group for the separate age intervals (10–13, 14–19, 20–24, 25–44, 45–64, 65 and over). For 1920 and 1930, he used the census data without adjustment. For 1900, minor adjustment was required in the reported data to develop estimates for the 10–13, 14–19, and 20–24 groups. For 1910, he used a preliminary set of rates roughly consistent with the adjusted U.S. estimate. The worker rates used for 1900, 1920, and 1930 necessarily differ from Durand's estimates (John Durand, *The Labor Force in the United States, 1890–1960*), as the latter are all adjusted to be comparable with the 1940 census totals, whereas the present series is comparable with the Current Population Survey estimates beginning 1940.

The worker rates for each age-sex-nativity group were interpolated to give annual estimates for 1900 to 1930, then applied to unpublished census data on population. Two adjustments were made in the data thus derived. Armed Forces overseas, excluded from the census series, were added to the preliminary labor-force series for 1917 to 1919. Secondly, the census estimates were based largely on school-attendance figures and other series not particularly sensitive to the inmigration of adult workers. Lebergott, therefore, computed a direct estimate for 1900 to 1914 of immigrant worker arrivals, and used that series as a measure of 1900 to 1914 labor-force trends among the foreign born.

The preliminary 1900 to 1930 employment trend series thus derived for persons aged 14 and over was used to interpolate between gainful-worker figures for 1900, 1910, 1920, and 1930. The decennial rates of gain were used to adjust from reported census date figures to annual averages. In addition, the reported 1910 figure was adjusted to allow for the overcount of that year. Lebergott estimated the adjustment for males 14 and over as for females, on the assumption that the overcounted group included only home-farm workers having the same age distribution as reported home-farm workers.

Interpolation between 1930 and 1940 benchmark totals was by means of the BLS total labor force series. The BLS series was derived by applying annual worker rates for age-sex groups to census population data for the corresponding groups. The worker rates were interpolations between estimated 1930 labor-force rates and those shown for 1940 by the Current Population Survey. The resultant series reflects changing proportions among the various age-sex groups, and these changes are reflected in the Lebergott series.

The unemployment series for 1900 to 1930 was derived by making direct benchmark estimates of unemployment in 1900, 1910, and 1930, using the population census data on unemployment in those years. Intercensal estimates were then obtained by estimating civilian labor force and employment and deducting one series from the other.

The estimate of unemployment in 1900 was based on data collected in two enumerations. One was the 1900 Census of Population, which secured information on unemployment during the year preceding the taking of the census. The second was a Cost of Living Survey made by the Commissioner of Labor of family income and expenditures that secured detailed information for about 25,000 families on cause and duration of unemployment during 1900–1901.

Although the census of 1910 secured data on unemployment of wage earners in the previous year, these data were not tabulated until 1948. The 1910 data on unemployment are in the form of distributions for unemployed wage earners 16 years and over by duration of unemployment. By applying the distribution to the total for wage earners 16 years and over, and deducting estimates made similarly for teachers and home-farm laborers (wage earners), Lebergott secured a preliminary estimate for the number of unemployed wage earners by duration group. The resultant distribution was reduced to exclude

unemployment that would not be counted by current definitions. He used the same proportions within each group as indicated in the 1901 Cost of Living Survey—multiplying by the same average duration figures, within each group, as used for 1900, and computing man-years of unemployment.

An annual average unemployment benchmark for 1930 was estimated as follows. Prior estimates (John Durand and Edwin Goldfield, *Estimates of Labor Force, Employment and Unemployment in the United States, 1940 and 1930*) indicated that 5.17 percent of the gainfully occupied total for April were unemployed. This ratio, applied to the census gainful-worker total for April, gives an April unemployment figure and, by subtraction, an employment figure. The annual average employment was estimated at 97.02 percent of the April level, using ratios for its agricultural, manufacturing, and other components. Adding Armed Forces overseas to this figure and subtracting from the annual average gainful-worker total gives an unemployment figure for 1930.

Following the procedure used for the original BLS estimates, but adopting a variety of revisions in the labor force and the component employment series, gives unemployment estimates for 1929–1939 that differ in trivial amount from those in the published BLS series except for 1929, which is approximately 20 percent different. Because of the widespread use of the BLS figures and because the differences are well within the error involved in the computation of the duplicating item, Lebergott adopted the BLS figures beginning 1930 as his unemployment totals, then subtracted these from the labor-force totals to give the employment series.

Beginning 1940, Lebergott adopted the Census Bureau's Current Population Survey reports, supplementing them for certain omissions. These data appear in *Current Population Reports*, series P-50.

See general note for series D 1–74 and also table and text for series D 11-25.

D 11–25. Labor force status of the population, 1870–1970.

Source: Annual data: 1947–1970, U.S. Bureau of Labor Statistics, **series D 11–19**, *Employment and Earnings*, monthly issues, tables A-1 and A-2; **series D 20–23**, unpublished data. Decennial data: U.S. Bureau of the Census, 1870–1930, *Twelfth Census of the United States: 1900*, Special Reports, *Occupations*, table IV, and *Fifteenth Census of the United States: 1930*, vol. IV, *Occupations by States*, tables 1.2 and 11; 1940–1950, *U.S. Census of Population: 1950*, vol. II, part 1, tables 52 and 118; 1960, *U.S. Census of Population: 1960*, vol. I, part 1, table 82; 1970, *U.S. Census of Population: 1970*, vol. I, part 1, table 90.

In 1953, population data from the 1950 census were introduced into the estimating procedure, affecting the comparability of the labor force figures with earlier years. Population levels were raised by 600,000; labor force, total employment, and agricultural employment levels were raised by 350,000, primarily in the figures for all persons and for males. Similarly, population data from the 1960 census were introduced in 1962, reducing the population totals by 50,000 and the labor force and employment totals by 200,000.

The inclusion of Alaska and Hawaii in 1960 resulted in an increase of about 600,000 in population and 300,000 in the labor force, four-fifths of which was in nonagricultural employment.

See general note for series D 1–74.

D 26–28. Gainful workers, by sex, by State, 1870–1950.

Source: Everett S. Lee, Ann Ratner Miller, Carol P. Brainerd, and Richard A. Easterlin, *Population Redistribution and Economic Growth, United States, 1870–1950*, vol. I, *Methodological Considerations and Reference Tables*, The American Philosophical Society, Philadelphia, 1957, table L-4. (Copyright.)

These series cover persons engaged in agricultural and nonagricultural occupations, shown separately in the source. The basic data are from the decennial censuses. To facilitate tabulation, the agriculture series was compiled directly and nonagricultural totals were obtained by subtraction from totals for all occupations.

Census tabulations of gainful workers during the period 1870–1930 included all persons 10 years of age and over. Beginning in 1940, however, tabulations of the labor force included only persons 14 years of age and over. The authors therefore constructed estimates of 10–13 year-old workers by sex for each State on the basis of the occupational distributions of 14–15 year-olds.

For 1870 through 1930 all gainful workers are included in the series. All experienced persons in the labor force are included for 1950, that is, all persons except those looking for their first jobs. The 1940 data refer to employed persons and to experienced workers seeking work but exclude persons on public emergency work.

For definition of "gainful workers," see text for series D 75–84.

D 29–41. Labor force, by age and sex, 1890–1970.

Source: Annual data, 1940–1946, U.S. Bureau of the Census, *Current Population Reports*, series P-50 and P-25; 1947–1970, U.S. Department of Labor, *Manpower Report of the President, March 1972*, pp. 158–159. Decennial census data, 1890–1930, John D. Durand, *The Labor Force in the United States, 1890–1960*, Social Science Research Council, New York, 1948; 1940 and 1960, U.S. Bureau of the Census, *U.S. Census of Population: 1960*, vol. I, part 1, tables 82–84; 1950, *U.S. Census of Population: 1950*, vol. IV, Special Reports, *Employment and Personal Characteristics*, p. 1A-62; and 1970, *U.S. Census of Population: 1970*, vol. I, part 1, table 215, and unpublished data.

The civilian labor force data are annual averages. However, the data on the Armed Forces and on the total population (the base for labor force participation rates) are estimates as of July 1 of the specified year.

See general note for series D 1–74 and also text for series D 11–25.

D 42–48. Civilian labor force as percent of civilian noninstitutional population, by race and sex, 1940–1970.

Source: See source for series D 29–41.

See general note for series D 1–74 and text for series D 11–25.

D 49–62. Marital status of women in the civilian labor force, 1890–1970.

Source: Annual data, 1940–1958, U.S. Bureau of the Census, *Current Population Reports*, series P-50; 1959–1970, U.S. Bureau of Labor Statistics, *Special Labor Force Reports*, various issues. Decennial data, U.S. Bureau of the Census, 1890–1930, *U.S. Census of Population: 1930*, vol. IV, table 25; 1940–1970, *U.S. Census of Population: 1970*, vol. I, tables 2, 3, and 5.

In the annual series, data for 1940 are based on complete count census data revised for comparability with the Current Population Survey; data for 1944–1970 are based on the Current Population Survey.

See general note for series D 1–74 and text for series D 11–25.

D 63–74. Married women (husband present) in the labor force, by age and presence of children, 1948–1970.

Source: U.S. Bureau of Labor Statistics, *Handbook of Labor Statistics, 1972*, table 14.

Children refer to "own" children of the family head and include stepchildren and adopted children.

See general note for series D 1–74.

D 75–84. Gainful workers, by age, sex, and farm-nonfarm occupations, 1820–1930.

Source: U.S. Bureau of the Census, Sixteenth Census Reports, *Comparative Occupation Statistics for the United States, 1870–1940*, pp. 93, 100, and 142.

The gainful worker concept differs radically from current labor force concepts as described in the general note for series D 1–74. The primary purpose of the gainful worker statistics was a count of occupations. The data were based on a question relating to occupational status and not to employment status as currently defined. Census enumerators were instructed to find and enter the occupation of each person 10 years of age and over who followed an occupation in which he earned money or its equivalent, or in which he assisted in the production of marketable goods. Thus, the term "gainful workers" includes all persons who usually followed a gainful occupation although they may not have been employed when the census was taken. It does not include women doing housework in their own homes, without wages, and having no other employment, nor children working at home, merely on general household work, or chores, or at odd times on other work.

The question as posed by the enumerator made no reference to time. The response thus varied substantially with the individual. Many persons who were retired or permanently disabled and who had not worked for some time reported their former line of work and were counted as gainful workers. On the other hand, many employed persons did not enter themselves as gainful workers, because they considered themselves as students or housewives and their current employment as only temporary.

These and other factors made for incomparabilities among different age and occupational groups from one decennial census to the next. The gainful worker statistics, however, are considered as a generally reliable measure of long-term trends during the time period covered.

For a more detailed discussion of the gainful worker concept and the data themselves, see John D. Durand, *The Labor Force in the United States, 1890–1960*, Social Science Research Council, New York, 1948, p. 191 *et seq.*; John D. Durand, "Development of the Labor Force Concept, 1930–40," *Labor Force Definition and Measurement*, appendix A, Social Science Research Council, Bulletin 56, 1947; and U.S. Bureau of the Census, Sixteenth Census Reports, *Population*, "Estimates of Labor Force, Employment, and Unemployment in the U.S.: 1940 and 1930."

D 85–86. Unemployment, 1890–1970.

Source: 1890–1928, see source for series D 1–10, tables A-3 and A-15; 1929–1970, U.S. Bureau of Labor Statistics, *Employment and Earnings*, May 1972.

For data prior to 1900, an 1890 benchmark was derived from the unemployment data reported in the 1890 and 1900 censuses. Data for the primary male groups in the labor force showed unemployment in 1890 at 79.31 percent of that in 1900. Applying this ratio to the 1900 unemployment rate gives an 1890 rate of 3.96 percent. This rate applied to an estimated 1890 total for the labor force aged 14 and over gives the 1890 unemployment figure.

Intercensal unemployment figures for 1891–1899 were derived by deducting an employment series from a labor-force series. The employment series is the adjusted sum of a number of detailed series, whose derivation is described in *Manpower in Economic Growth*, pp. 421–478.

The figures for 1900–1939 represent estimates of unemployment on as comparable a basis as possible to current labor force concepts. There have been many estimates of unemployment for these years prepared by such agencies as the National Industrial Conference Board and by authors such as Paul Douglas in *Real Wages in the United States, 1890–1926* (these are discussed and compared in Lebergott, cited above). In all of these, including the series presented here, unemployment was calculated as a residual. That is, estimates were first made of the civilian labor force, then of employment; the difference between the two provides the estimates of unemployment. The figures for decennial census years were used as benchmarks, with interpolations made for intercensal years from a variety of available sources.

Beginning with 1940, figures were obtained from the U.S. Bureau of the Census Current Population Survey. These data appear in the Census Bureau's series P-50 reports and, beginning 1958, in the Bureau of Labor Statistics monthly *Employment and Earnings*.

See general note for series D 1–74 and text for series D 87–101.

D 87–101. Unemployment rates for selected groups, 1947–1970.

Source: U.S. Bureau of Labor Statistics, *Handbook of Labor Statistics, 1972*, pp. 128–129, and 144.

The unemployment rate represents the percent of the civilian labor force reported as unemployed by the Current Population Survey during the survey week (the week containing the 12th of each month). Annual figures shown here are averages of monthly figures.

Duration of unemployment represents the length of time (through the end of the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of two weeks or more during which a person was employed or ceased looking for work breaks the continuity of the present period of seeking work. Series D 99 represents the unemployment rate calculated as a percent of the civilian labor force. Average duration, series D 100, is an arithmetic mean computed from a distribution by single weeks of unemployment.

State insured unemployment refers to persons seeking benefits under State unemployment insurance programs. Series D 101 represents the unemployment rate for the survey week calculated as a percent of average covered employment.

See general note for series D 1–74.

D 102–115. Unemployment rates, by industry, 1948–1970.

Source: U.S. Bureau of Labor Statistics, *Handbook of Labor Statistics, 1972*, p. 151.

See general note for series D 1–74 and text for series D 87–101.

D 116–126. Persons with a job but not at work and civilians employed, by hours worked, 1950–1970.

Source: U.S. Bureau of Labor Statistics, *Employment and Earnings*, May issues.

Hours of work statistics relate to the actual number of hours worked during the survey week. (See general note for series D 1–74.) For example, a person who normally works 40 hours a week but who was off on the Veterans Day holiday would be reported as working 32 hours even though he was paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week, and all the hours are credited to the longest job.

Persons who worked 35 hours or more in the survey week are designated as working "full time"; persons who worked between 1 and 34 hours are designated as working "part time."

D 127–141. Employees on nonagricultural payrolls, by major industry divisions, 1900–1970.

Source: 1900–1928, see source for series D 1–10, table A-5; 1929–1970, U.S. Bureau of Labor Statistics, *Handbook of Labor Statistics, 1972*, p. 89.

Data from payroll records, submitted voluntarily by over 160,000 employers, provide (1) current information on wage and salary employment, hours, and earnings in nonagricultural establishments, and (2) job vacancies and labor turnover in manufacturing, by industry and geographic location. These statistical programs are conducted by the Bureau of Labor Statistics (BLS) in cooperation with State agencies.

The two types of data collection documents used are of the "shuttle" type, with spaces for each month of the calendar year. The cooperating State agencies mail the reporting forms to the participating establishments each month, use the information to prepare State and area estimates, and then send the basic data to BLS in Washington for use in preparing national series.

Employment data refer to persons on establishment payrolls who receive pay for any part of the reference pay period, and include workers on paid sick leave (when pay is received directly from the firm), on paid holiday or paid vacation, and those who work during a part of the pay period and are unemployed or on strike during the rest of the period. Proprietors, the self-employed, unpaid family workers, farmworkers, and domestic workers in households are excluded. Government employment covers civilian employees only.

Periodically, the industry employment series are adjusted to recent benchmarks to improve their accuracy. These adjustments may also affect the hours, earnings, and labor turnover series since employment levels are used as weights. Industry data for these series have been adjusted to March 1970 benchmarks.

Total employment in nonagricultural establishments from the "payroll" survey is not directly comparable with the estimates of nonagricultural employment obtained from the monthly "household" survey (Current Population Survey). The household survey includes the self-employed, unpaid family workers, and private household workers and is basically a count of persons. The payroll series, in contrast, excludes these workers and is basically a count of jobs. Thus, the multiple jobholder, counted only once in the household survey, would be counted once for each job by the payroll survey. Employment estimates developed by quinquennial censuses may differ from payroll estimates due, primarily, to the reporting practices of multiproduct establishments, and administrative handling of central offices and auxiliary units.

For a more detailed description of these programs see Chapter 2, "Employment, Hours, and Earnings," of the *Handbook of Methods for Surveys and Studies*, BLS Bulletin 1711.

The data summarized in these series are available in considerable detail (estimates are provided for about 400 different industries each month). For a discussion of available historical data, see Bureau of Labor Statistics, *Employment and Earnings, United States, 1909–1971*, Bulletin No. 1312–8; for an analysis of historical trends, see Seymour L. Wolfbein, "Changing Patterns of Industrial Employment," *Monthly Labor Review*, March 1956.

D 142–151. Production or nonsupervisory workers on private nonagricultural payrolls, by industry division, 1909–1970.

See text for series D 127–141.

D 152–166. Industrial distribution of gainful workers, 1820–1940.

Source: Solomon Fabricant, "The Changing Industrial Distribution of Gainful Workers: Some Comments on the American Decennial Statistics for 1820–1940," *Studies in Income and Wealth*, vol. 11, National Bureau of Economic Research, New York, 1949, p. 42. (Copyright.)

For definition of "gainful workers," see text for series D 75–84.

The data are based almost entirely on estimates in the following monographs which were prepared mainly from data collected in the decennial censuses of population: P. K. Whelpton, "Occupational Groups in the United States, 1820–1920," *Journal of the American Statistical Association*, September 1926; U.S. Bureau of the Census, Sixteenth Census Reports, *Comparative Occupation Statistics for the United States, 1870 to 1940*; and Daniel Carson, "Industrial Composition of Manpower in the United States, 1870–1940," *Studies in Income and Wealth*, vol. 11.

D 167–181. Labor force and employment, by industry, 1800–1960.

Source: See source for series D 1–10, table A-1.

The individual series on labor force and employment for 1800 to 1960 were derived in extensive detail. A full description of the procedures used appears in a Conference on Research in Income and Wealth, *Studies in Income and Wealth*, vol. 30, pp. 132 ff. The data represent revisions of some of the materials used for series D 152–166 and are intended to be comparable with current official series.

D 182–232. Major occupation group of the experienced civilian labor force, by sex, 1900–1970.

Source: U.S. Bureau of the Census. 1900–1950 (1950 classification), David L. Kaplan and M. Claire Casey, *Occupational Trends in the United States, 1900–1950*, Working Paper No. 5, 1958; 1950–1960 (1960 classification), *U.S. Census of Population: 1960*, vol. I, part 1, table 201; 1960 (1970 classification)–1970, *U.S. Census of Population: 1970*, vol. I, part 1, table 221.

The data for 1900–1950 (1950 classification) constitute primarily an updating by Kaplan and Casey of the material in Sixteenth Census Reports, *Comparative Occupation Statistics in the United States, 1870–1940*. Separate series developed by Alba M. Edwards in that report were brought together and a number of new estimates were prepared to fill gaps. The appropriate figures were then adjusted to conform to the definitions used in the 1950 occupational classification system. Except where there was firm evidence to support a change, Edwards' basic assumptions and estimates were utilized throughout.

The source cautions that the data, particularly those for 1900, are approximations only. The estimates for 1900 "were included mainly for the purpose of rounding out a half-century of information, despite some obvious deficiencies. Particularly prior to 1910, there is little information available on the exact definitions used for the several occupational categories. And, even for fairly recent years, there is often only meager statistical intelligence on which to base adjustments for comparability with the 1950 definitions."

The universe covered in the Kaplan and Casey series is described as the "economically active population." Prior to 1940, this refers to civilian gainful workers 10 years old and over; for 1940 and 1950, it refers to persons 14 years old and over in the experienced civilian labor force (all employed and unemployed workers with previous work experience). Two incomparabilities should be noted. First, there are important differences between the gainful worker and labor force concepts (see general note for series D 1–74, and text for series D 75–84). Second, there is the difference in age limitation. The inclusion of the 10-to-13 group prior to 1940, and their exclusion in 1940 and 1950, follows the census practice in those years.

The occupation classification system used in the 1970 census is similar to that used in each decennial census since 1940. However, the changes made for each of the censuses affect the comparability of data from one census to another. For example, many of the larger 1960 occupation categories were divided into several smaller categories which increased the number of categories in the 1970 system to 441, compared with 297 in 1960.

A new major group, "transport equipment operatives," added to the occupation classification in 1970, includes occupations formerly part of the "operatives" major group. The arrangement of some

major groups was changed to form more "families" of occupations. This applies especially to the "professional" and "service" major groups. Although there was an effort to limit changes between major groups, there were many cases where such changes were necessary. One such change is the treatment of apprentices. They were moved from "operatives" to "craftsmen" and are classified as a subcategory of their craft.

Two other changes in the census have an important effect on comparability: (1) The allocation of "not reported" cases to the major groups in 1970 increased the size of those totals relative to the totals for 1950 and 1960 when there was no allocation of these characteristics; and (2) the age coverage for statistics on these subjects to accord with past and current definitions of the labor force, as indicated in the table for series D 182–232.

The population census occupational classification system is generally comparable with the system used in U.S. Bureau of Employment Security, *Dictionary of Occupational Titles* (DOT), 3d edition, with the exception of the blue collar workers (i.e. manual and service workers). The DOT structure for these occupations is quite different from that used by the Bureau of the Census. An important reason for this is that the two systems are designed to meet different needs and to be used under different circumstances. The DOT system is designed primarily for employment service needs, such as placement and counseling, and is ordinarily used to classify very detailed occupational information obtained in an interview with the worker himself. The census system, on the other hand, is designed for statistical purposes and is ordinarily used in the classification of limited occupational descriptions obtained in a self-enumeration questionnaire or in an interview with a member of the worker's family.

D 233–682. Detailed occupation of the economically active population, 1900–1970.

Source: See source for series D 182–232.

Dashes (------) are used in the columns of this table to denote that comparable data are not available because of changes in definitions and occupations.

* Denotes first year for which figures include Alaska and Hawaii.
[1] 1870–1930, total population includes institutional.
[2] 1940–1970, includes Armed Forces.
[3] Not available on basis consistent with "total not in labor force."
[4] Data for persons 14 years old and over.
[5] Estimated from data based on different sample.
[6] Data for persons 10 years old and over reporting a gainful occupation.
[7] Revised figures for total and male and female; uncorrected figures for white and Negro and other races.

Series D 26–28. Gainful Workers, by Sex, by State: 1870 to 1950

[In thousands of workers 10 years old and over]

Series D 29–41. Labor Force, by Age and Sex: 1890 to 1970

[**Labor force in thousands of persons 16 years old and over except, prior to 1947, 14 years old and over.** Annual estimates are averages of monthly figures. Includes Armed Forces overseas, except for decennial data. The introduction of data from the decennial censuses into the estimation procedure in 1953 and 1962 and the inclusion of Alaska and Hawaii beginning 1960 have resulted in 3 periods of noncomparability; see text for series D 11–25]

Year	Total labor force	Male						Female

* Denotes first year for which figures include Alaska and Hawaii.
[1] As of April. [2] Single includes widowed or divorced.
[3] Data not comparable with earlier or later censuses due to difference in basis of enumeration. The importance of returning "the occupation, if any, followed by a child of any age or by a woman," was emphasized in the printed instructions to census enumerators in 1910, but not in instructions in other censuses, and it is believed that enumerators in 1910 enumerated as gainful workers many women who would not have been enumerated in other censuses—particularly as agricultural laborers.

Series D 63–74. Married Women (Husband Present) in the Labor Force, by Age and Presence of Children: 1948 to 1970

[As of March, except as noted]

Year	Number in labor force (1,000)						Labor force participation rate [1]

1850	7,700	4,900	25	90	1,260		420			940					65
1840	5,420	3,720		15	790										895
1830	3,930	2,770													1,160
1820	2,880	2,070			350										460

[1] Comparable with 1940.
[2] Difference between number of persons not reporting industrial affiliation (1,335,000) and excess of the "gainful worker" total over the "labor force" total (1,190,000).
[3] Comparable with data for earlier years.
[4] Comparable with data for later years.
[5] Figure corrected for apparent error in source; components now add to total, series D 152.

Z Less than 500.
[1] Includes persons for whom occupations were not reported.
[2] Includes occupations not shown separately.
[3] Includes data in series D 303, D 305, and D 307.
[4] Includes data in series D 304, D 306, and D 308.
[5] Business services included with automobile and miscellaneous repair services and garages.
[6] Excludes tractor drivers.
[7] Includes babysitters, not shown separately.
[8] Includes carpenters' helpers, truck drivers, helpers, and warehousemen, not shown separately.

Chapter D

Earnings, Hours, and Working Conditions (Series D 683-1036)

D 683–688. Indexes of employee output (NBER), 1869–1969.

Source: U.S. Bureau of Economic Analysis, *Long Term Economic Growth, 1860–1970*, pp. 210–211.

The productivity indexes in the source publication are from John W. Kendrick, *Productivity Trends in the United States*, 1961, and *Postwar Productivity Trends in the United States, 1948–1969*, National Bureau of Economic Research, New York (copyright).

D 683 and **D 684–686**, indexes of output per man-hour. Kendrick derived these series by dividing the appropriate output series (gross private domestic product, gross nonfarm product, manufacturing output, and gross farm product) by the corresponding man-hours series.

D 689–704. Indexes of output, man-hours, compensation per man-hour, and unit labor cost (BLS), 1947–1970.

Source: U.S. Council of Economic Advisors, *Economic Report of the President*, January 1972, p. 234. Data are from the U.S. Bureau of Labor Statistics (BLS).

These series are based primarily on BLS surveys of establishments. The output measure, gross national product (GNP), represents the market value, in 1958 dollars, of final goods and services produced in the economy. It includes the purchases of goods and services by consumers, business establishments, foreign investors, and various government agencies. The GNP data (see series F 3) were prepared by the U.S. Bureau of Economic Analysis. In developing the man-hour series, data from labor force reports and national income series were used to supplement BLS payrolls series data.

The indexes of compensation per man-hour and unit labor cost were developed from man-hour estimates based on data from establishments. Compensation includes wages and salaries, plus supplemental payments such as contributions of employers to social security and private health and pension funds. The compensation data include an estimate for proprietors' salaries and contributions for supplementary benefits. Real compensation per man-hour can be derived by adjusting the compensation data by the consumer price index to reflect changes in purchasing power. The indexes of unit labor costs were developed by dividing compensation per man-hour by output per man-hour (see series W 22–25).

See also general note for series D 1–74 and data and text for series W 22–29.

D 705–714. Farm laborers—average monthly earnings with board, by geographic divisions, 1818–1948.

Source: Stanley Lebergott, *Manpower in Economic Growth: The American Record Since 1800*, tables A-23 and A-24, pp. 257ff. (Copyright 1964; used with permission of McGraw-Hill Book Co., New York.)

For most of the nineteenth century and well into the twentieth, the common method of wage payment in agriculture was monthly, with board included. Reasonably satisfactory data for individual States are available at something like decennial intervals for the entire period beginning with 1818. These figures have been supplemented with partial information to provide national estimates for the years for which this is not so. State data for 1818–1919 were combined into division and U.S. averages using weights from the population census. For 1909 and 1919, they therefore differ from U.S. Department of Agriculture (USDA) division totals.

For 1818, 1826, and 1830, estimates were made in 1832 by Senator John Holmes of Maine, and reported by him in the Congressional *Register of Debates*. For certain States there are, in addition, the results of a survey in 1832–1834 on 1832 farm wages made by Secretary of State Edward Livingstone, drawing on returns from many individual towns in these States—i.e., 59 of 134 towns in Connecticut, 101 of 444 in Maine, 109 of 230 in New Hampshire, etc. Given the broader basis of the Secretary's survey, his figures were used to represent the 1830 average (other data indicating virtually no 1830–1832 change) with the Holmes series used to extrapolate these values to 1818 and 1826. For 1818, 1826, and 1830, the total number of persons reported by the 1820 census as having agricultural occupations was used for weighting.

For 1850 and 1860, special wage-rate inquiries made in connection with census reports on social statistics gave monthly rates paid to farmhands (with board) and were used here.

For 1850, the number of free white male farmers aged 15 and over was used for weighting, and for 1860, the number of farm laborers. Examination of the ratios of farmers to farm laborers in 1860 indicated a marked degree of intrastate uniformity so that the shift from one type of weights to the other would not make a marked difference.

The source used for 1870 was a study made by Edward Young, Chief of the Bureau of Statistics of the Treasury Department, in which figures on wage rates in a host of occupations were collected. Because of the timing, it is possible that these data were collected in connection with the 1870 census. The data were more probably developed as the other materials in the volume were, from information secured by the assistant assessors of internal revenue in the various States. Their issuance, however, under the sponsorship of a competent statistician, who was experienced in data evaluation and presentation and who had worked under David A. Wells, entitles them to serious consideration.

For 1880 and 1890, the crop-reporter surveys of the USDA were used to provide State estimates.

For 1899, the USDA survey reported not rates for men hired "by the year"—as do the reports used for earlier periods—but "by the year or season." In examining the extent of noncomparability, Lebergott was limited to a comparison between the two types of rates for 1909, that being the only year for which the USDA reported both types of rates.

Day rates (other than harvest) were charted against monthly rates by the year and season for the years 1891 to 1909. The scatter showed a close and simple correlation for all years except 1909. Given the scatter and the day rate for 1909, Lebergott deduced a 1909 rate for the year and season that is virtually the same as the enumerated "year" rate for that date. On this basis he took the year-season rate for 1899 as roughly identical with the desired year rate for that date. He secured the same result by charting the year rates for 1866 to 1890 and 1909 against the daily rate (other than harvest) and interpolating for 1899 by the daily rate. It was therefore concluded that the "year-season" State rates for 1899 as actually reported could be used as satisfactory approximations of the year rates for that date.

For 1870 and 1880, the population census counts of agricultural laborers aged 16 to 59 were used as weights. For 1890 and 1899, the census count of male agricultural laborers aged 16 and over in

1900 was used. For 1909 and 1919, the division estimates of the USDA were not used because they were weighted by the number of farms employing hired labor at any time during the year. Such weights will distort the relative importance of States that characteristically hired above (or below) average proportions of migrant labor, or short-term labor. Thus, while New Jersey reported roughly as many farms with hired labor in the agricultural census as it did hired laborers in the population census, North Dakota reported almost twice as many. The population census count of farm laborers (working off-farm) was therefore used to compute regional and U.S. averages.

For 1929 and 1940, the USDA division figures were used, these having been weighted by the count of hired farm workers derived from the surveys themselves. For 1948, the 1950 Census of Agriculture count of hired farm workers was used.

D 715–717. Average daily wage rates of artisans, laborers, and agricultural workers, in the Philadelphia area, 1785–1830.

Source: Donald R. Adams, Jr., "Wage Rates in the Early National Period: Philadelphia, 1785–1830," *The Journal of Economic History*, Economic History Association, New York, September 1968. (Copyright.)

The ranges of wage rates shown for certain years are the result of multiple observations within those years. Single rates for a given year indicate that all observations for that date were identical.

The principal manuscript sources utilized in constructing these series are as follows: Pennsylvania Historical Society, *Joshua Humphreys Shipyard Accounts*, and *Moses Lancaster Account Book*; American Philosophical Society, *Treasurer's Account Book*; Records of the Ship *North Carolina, American State Papers, I*, Class VI (Washington: Gales and Seaton, 1834), p. 836; Stephen Girard Collection: *Ship Disbursements and Repair Records* (Ship *Good Friends*, Ship *Liberty*, Brig *Polly*, Brig *Kitty*, Ship *Two Brothers*, Ship *North America*, Ship *Helvetius*, and Ship *Superb*); *Bills and Receipts; Bills and Receipts Alphabetically; Place Accounts; New Houses and Stores in Water Street No. 2*; and *Real Estate Accounts*. Wage rates were obtained from the actual receipts, bills, day books, and account books.

Wage contracts in agriculture were often stated on a monthly or annual basis. The problem of determining average monthly wage rates was enhanced by the wide range of rates observable within any given year. Since the manuscript sources do not indicate any discernible seasonal trend, the differences encountered most likely lie in the differences in payment in kind or "found." In practice, the averages are simple arithmetic means of the observations for a given year.

A few examples of the variety in the content of such nonmonetary payments from the *Peale Day Book* and the *Peale-Sellers Belfield Farm Book* indicate the difficulty of making total wage estimates:

Date	*Wage Rate ($)*	*Content of Found*
June 1810	100/yr.	Mending, washing, and lodging
Oct. 1810	120/yr.	Meat, drink, washing, and lodging
Apr. 1811	10/mo.	Board and washing
July 1818	11/mo.	Finding his own wash

Special daily rates often applied at harvest time or for particular tasks:

Date	*Wage Rate ($)*	*Sex*	*Function*
1812	0.50/day	Female	Mowing hay
1814	1.25/day	Male	Mower
1814	0.625/day	Male	Making hay
1815	1.25/day	Male	Reaper

Examples of piece rates can also be found. During harvest periods in 1817 and 1818, according to the Girard *Place Accounts*, mowers were paid at the rate of $2.00 per acre.

As indicated in the manuscripts, $8.00 to $12.00 per month was perhaps the most common range for agricultural laborers—falling below $8.00 in only three years and rising above $12.00 in only four years—while the average monthly wage fell into the narrower range of $9.00 to $11.00 per month.

D 718–721. Daily wage rates on the Erie Canal, 1828–1881.

Source: Walter B. Smith, "Wage Rates on the Erie Canal, 1828–1881," *The Journal of Economic History*, Economic History Association, New York, September 1963, p. 298. (Copyright.)

The original sources of Smith's data are the check-rolls and workmen's receipts for payment for repair and maintenance work on the canal, as given in the Erie Canal Papers on deposit in the New York State Library in Albany. The tasks of the work gangs were such enterprises as: Leveling the tow path, cleaning the canal each spring, raising sunken boats, making emergency repairs of breaches caused by floods, breaking the ice in late autumn and keeping the locks and "feeders" in good working order. The data come largely from work of repair rather than of enlargement and new construction. On the check-rolls are the names of the workmen, their classification, the number of days worked, the daily wage rates, and the total wages paid. Most reports contain brief descriptions of the kinds of projects undertaken by the gangs. The reports in 1828 and later years are much clearer than those of earlier dates. The attempt accurately to determine the wage rates before 1828 was frustrated by the earlier practice of recording a man's name and the amount paid to him without specifying clearly the kind of work done. In 1819, it seems probable that the common labor rate was $1.00 a day and in 1823 and 1826, 75 cents. But there is a certain amount of conjecture in these statements, and not until 1828 were wage payments accompanied by a clear indication of occupational status.

For operation and maintenance purposes the 350-odd miles of the Erie Canal (the main line) were administered in three main divisions: The first extended from Albany to Utica (later to a point a little farther west), the second from Utica to Montezuma, and the third from Montezuma to Buffalo. The divisions were subdivided into sections of about 25 miles each, for which a Superintendent of Repairs was responsible. Under their control were the gang foremen, who not merely hired the men and supervised the work but who usually prepared the check-rolls. The gangs were by no means all alike; some were specialized, for example, carpenters; others were general purpose groups; some worked regularly month after month for full months, others worked only occasionally and only for a few days; and some included several hundred men (usually for emergency employment), others consisted of only five or six. The check-rolls, an integral part of the accounting and payments process on the canal, were forwarded bimonthly by the superintendents of repairs to the canal auditor as vouchers attached to his Abstract of Returns. From these records were collected about 30,000 cases of wage rates, a number sufficiently large to give a stable and dependable average rate, by months, for each of the three main divisions of the canal. The continuity of the record is, unfortunately, broken between 1867 and 1870 owing to the adoption of the "contracting-out system" for repairs in those years.

The Erie Canal was important not only as a carrier, but also as an institution of great interest to the politicians concerned with patronage. The outcome of numerous legislative inquiries was a statute specifying that repair work be let to contractors; the statistical consequence was an almost complete absence of reports of wages for the interesting years of post-Civil War price adjustment, January 1867 to April 1870. The contracting-out system did not work very well, and the former system of making repairs was soon restored. Beginning with April 1870, wage statistics once more became abundant and continuous, and continued to be so until 1879 when the responsibility for repairs was taken over by the New York State Superintendent of Public Works.

Eight hours became the legal workday in April 1870. In the midst of the confusion attendant on a return to the older method of making repairs, it became necessary to adjust the reporting system to this

eight-hour day regulation. Actually, the effect of the law regarding the length of the working day was nominal rather than substantive. Men continued to work for ten hours a day on the canal as they had for many years and the only immediately observable change was the quotation of daily wage rates at four-fifths of the previous amount and a recording of all workmen as working at time-and-a-quarter a day. In series D 718–721, the check-roll quotations beginning with May 1870 were multiplied by five-fourths in order that the rates shown be for a ten-hour day.

About nine-tenths of the wage quotations in the vouchers were for male common labor, and almost all of the remainder were for carpenters, masons, foremen, and that combination of a team of horses and their driver consistently recorded as "teamwork." The large number of reported wage payments to common labor made it easily possible to determine a modal wage rate by months for each of the three divisions of the canal. The annual wage rate figures for series D 718–721 were derived from the monthly rates. Carpenters and teamworkers were sufficiently numerous to warrant confidence in the annual wage rate series for the canal as a whole. The reports about masons were less satisfactory: the number was small and there are gaps in the reports extending for months at a time. The data for masons suggest that masons' wages were about the same as those of carpenters. The only wages for women on the rolls were for cooks. They were invariably employed on the State scow and generally they received wages half those of common labor.

The mode was used to represent the central tendency in the wage returns. In over 60 percent of the months *all* common laborers received identical wages and in the remaining months the deviations from the mode were small both in number and amount. Wage records on the canal were specified in New York shillings (eight to the dollar) and pence, and when deviations from the mode occurred or when wages changed generally the amount of change was sometimes a sixpence but more often a shilling. Owing to the size of the unit in which wage changes took place, the mode seems to be unstable in periods of transition. A computed mean would have been more continuous but would not necessarily have been more representative of the general wage rate than the mode.

The difference between the mode and the arithmetic mean was not great. The average deviation of the means from the corresponding modes for common labor in the eastern division for the month of June (1828–81) was eight-tenths of a cent. In 31 out of 48 years for which data existed, the means and the modes were identical. The record for 1857, a good year for testing the differences between the mean and the mode, disclosed that out of 778 cases of wage rates for common labor in the eastern division, 759 men received $1.00 a day and only 19 received $1.125. The mean exceeded the mode by three-tenths of a cent.

The sampling procedure used in this study was dominated by the condition of the surviving records and by the practical difficulty of finding the reports of the superintendents of repairs among the thousands of bundles of manuscripts. The surviving data are ample for some times and places of employment and very scarce or non-existent for others. The author made a complete tabulation of all the data on rolls when only a few were found; when abundant, the data on five or six rolls were transcribed in entirety. Rolls containing several hundreds of cases were not used. Further search for data after the total number of wage rates approached a thousand in a given year hardly seemed worthwhile.

Lack of elegance in sampling technique was less significant for the validity of the results than were the occasional gaps in the continuity of the records. For example, no statistics could be found for the period between October 1849 and 1851 for the eastern division of the canal. This and other similar gaps in the records affected the geographical composition of the sample.

To test the reliability of the findings, the modal wage rates, by months, were subjected to an internal check. The rates for the eastern and western divisions were compared and found to be in agreement in 45 percent of the cases. Where differences existed they were small and temporary—rarely by more than a New York shilling or for more than a month or two. Wages tended to be lower in the western division than in the eastern part of the canal, but this was far from being consistently the case. The agreement between wages in the eastern and the middle divisions was close. This internal agreement suggests that the quotation of an annual wage for the canal as a whole is not seriously misleading.

D 722–727. Average annual earnings of employees, 1900–1970.

Source: **Series D 722**, U.S. Office of Business Economics (OBE), 1929–1963, *The National Income and Product Accounts of the United States, 1929–65, Statistical Tables;* 1964–1967, *U.S. National Income and Product Accounts, 1964–67;* 1968–1970, U.S. Bureau of Economic Analysis, *Survey of Current Business*, July 1971, table 6.5. **Series D 723–727**, see source for series D 705–714, table A-16.

See also text for series D 739–764.

Full-time earnings, series D 722, were computed as weighted averages of the series for individual industries as described in text for series D 739–764. The weights were the numbers employed by industry. The income loss from unemployment was estimated by applying to the full-time earnings figure the relevant unemployment percentage—for civilian labor force or nonfarm employees. This income loss, when subtracted from the full-time earnings (i.e., "when employed"), gave the earnings after deduction for unemployment. Both series D 723 and D 724 were deflated by the consumer price index to yield real earnings when employed and after deduction for unemployment, series D 725 and D 726. The price index was the Bureau of Labor Statistics index 1913–1960 extrapolated by Albert Rees to 1900. (Albert Rees, *Real Wages in Manufacturing, 1890 to 1914*, National Bureau of Economic Research, New York, 1961.)

D 728–734. Daily wages of five skilled occupations and of laborers, in manufacturing establishments, 1860–1880.

Source: Clarence D. Long, *Wages and Earnings in the United States, 1860–1890*, National Bureau of Economic Research, New York, 1960, p. 144 (copyright).

These series were compiled from Tenth Census Reports, *Report on the Statistics of Wages in the Manufacturing Industries With Supplementary Reports on the Average Retail Prices of Necessaries of Life and on Trade Societies, and Strikes and Lockouts*, vol. XX, 1886, by Joseph D. Weeks.

Weeks gathered his data from payroll records to give a continuous wage history of the same occupations in the same firms for some one date each year over a considerable period. In each of the more prominent manufacturing, mechanical, and mining industries in various sections of the country, "typical" establishments were selected, based on their age, standing, productive capacity, and general reputation. The mailing list of firms was said to be prepared after much correspondence with experts in each industry and recourse to trade directories and publications. No important branch of manufacturing was overlooked, but information on some was not returned or was unsatisfactory. Of the more than 50 industries with satisfactory returns, less than 20 could be used in Weeks' investigation, for only that many had wage data covering the entire period 1860–1880. The data do not usually cover overtime, holiday and Sunday work, and other extra earnings, and any payments to helpers and underhands have been deducted, so that the worker's wage covers what he received only for his own work. Weeks attempted to convert piece rates into daily wages wherever the firms could furnish information on time put in by piece workers.

For these series, Long used 85 establishments to compute the average daily wage: 26 for blacksmiths' wage; 10 for carpenters'; 25 for engineers'; 15 for machinists'; 9 for painters'; and 78 for laborers'.

D 735–738. Average annual and daily earnings of nonfarm employees, 1860–1900.

Source: See source for series D 705–714, table A-19 and pp. 289ff.

See also text for series D 722–727, D 728–734, and D 739–764.

There are two sets of data collected in the 1880–1890 period relative to the course of wage rates during and after the Civil War. One, "Report on Wholesale Prices, on Wages and on Transportation" (52d Cong., 2d Sess., 1893), termed the "Aldrich reports," was based on reports collected by the Commissioner of Labor in the early nineties; the other, "Report on the Statistics of Wages in Manufacturing Industries" (1886), collected as part of the 1880 census, is termed the "Weeks reports."

Lebergott rejected the Aldrich reports with their geographic, industrial, and occupational biases and relied on the Weeks reports, which have an enormously broader scope because they come from many more establishments, in more States, without the occupational biases in some of the key Aldrich reports. He used the Weeks reports primarily for interpolating between benchmarks derived from the population census and other reports and checked the movement of the series thus derived against an extensive set of contemporary investigations made by David A. Wells as Special Commissioner of the Revenue.

The wider scope of the Weeks reports has made them attractive to previous investigators. Their lack of use reflects the fact that, although many wage series are reported, no occupational weights are attached to them. To develop reasonable weights for the Weeks materials from the population census data on gainful workers by occupation, Lebergott utilized the occupational wage series to measure the trend of wages within a given occupation. Thus, he used a report for the trend of earnings by common labor in Pennsylvania and combined it with other Weeks reports on common-labor rate trends in Pennsylvania machine shops, blast furnaces, rolling mills, hardware, paper, tanneries, furniture, etc. He treated each of these as random observations of the trend for wages of that group and combined these series to interpolate between benchmark estimates for common labor in Pennsylvania. Similar combinations and interpolations were made for common labor in the other States. The State benchmarks for 1850 and 1860 are from the population census reports for those years; for 1870 from the Treasury *Report on Immigration*; and for 1880 from the census data on rates paid in iron and steel, coke, stone, and other industries.

Employees in other nonfarm occupations were allocated to 1860 wage intervals and the trend in the Weeks data for these wage intervals was used as the trend series for these groups. This amounts to saying that the trend of earnings for machinists, wheelwrights, carpenters, painters, and others reported by Weeks, who were classifiable in the $1.50 to $1.99 wage interval in 1860, should be similar to the trend for all other workmen in that interval.

The parallelism of wage movement for individual occupations within a wage-rate interval can be verified by study of the trend for individual occupations, such trends being apparent in the raw data.

The key figures involved are summarized below:

1860 Census

(In thousands)

Total nonfarm employees	2,983
Laborers	972
Miners, boatmen, and others earning $1.00 to $1.49	453
Carpenters, blacksmiths, and others earning $1.50 to $1.99	744
Domestic servants	566
All others	248

Given the above distribution of employees and their derived average daily earnings in 1860, Lebergott utilized the Weeks data (as summarized in Wesley Mitchell, *Gold Prices and Wages Under the Greenback Standard*, 1908) as follows. Mitchell had combined the hundreds of quotations into wage-interval groups and computed indices of medians for each interval—e.g., 25–99 cents, $1–$1.49, etc.—for 1860 to 1880. Lebergott weighted these indices by the 1860 employment distribution shown above and computed an index for all nonfarm employees. Then, for each year, he computed the ratio of the resultant median to that shown by Mitchell as the median for the $1–$1.49 interval.

This ratio was then applied to the series for laborers previously derived to give an overall average. Because the trend in medians would not be satisfactory as a measure of the trend in averages, the median data were used only to derive adjustment ratios with which to step down the laborers trend to an all-employees trend.

D 739–764. Average annual earnings per full-time employee, by industry, 1900–1970.

Source: 1900–1928, see source for series D 705–714, table A-18 and pp. 480ff. 1929–1967, U.S. Office of Business Economics, 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965, Statistical Tables;* 1964–1967, *U.S. National Income and Product Accounts, 1964–67;* 1968–1970, U.S. Bureau of Economic Analysis, *Survey of Current Business*, July 1971, table 6.5.

These estimates are ratios of aggregate wage and salary payments, by industry, to the aggregate number of full-time equivalent employees, by industry. Wages and salaries include executives' compensation, bonuses, tips, and payments in kind, and exclude those sources of labor income appearing in series D 893–912 as "supplements to wages and salaries."

Full-time equivalent employment measures man-years of full-time employment of wage and salary earners and its equivalent in work performed by part-time workers. For a discussion of the concept of full-time equivalent employment and the methods of estimation involved in converting part-time work to its full-time equivalent, see the *Survey of Current Business*, June 1945, pp. 17–18.

Since 1939, private industry employment and payrolls have been based principally upon records of the Social Security programs. For 1929–1938, the employment and payrolls figures are extrapolations backward from 1939, based on sources and methods similar to those used by Lebergott. The mainstay of the private industry estimates has been data of the State Unemployment Insurance (UI) programs as compiled by the U.S. Department of Labor. Additions were made for employment covered by Old-Age, Survivors, Disability, and Health Insurance (OASDHI) but not by UI—e.g. employment in small firms omitted from UI coverage under some State laws. Railroad Retirement Act coverage came from the Interstate Commerce Commission's *Transport Statistics* except that certain employment covered by the Railroad Retirement Act but not reported to the Interstate Commerce Commission was estimated from Railroad Retirement Board data.

This general method was followed except for categories for which more reliable data were available from other sources or where the proportion of firms not covered by Social Security programs was large: Agriculture, forestry, and fisheries; hospitals; private higher education; religious organizations; and private households. Data for these were obtained from the U.S. Department of Agriculture (USDA), the American Hospital Association, the Office of Education, and various governmental censuses and surveys.

Employment and payroll figures used as a basis for earnings in government and in private households were: (1) For the Federal Government, reports of the Civil Service Commission, records of the Armed Services, and (for 1933–1943) records of the Federal work relief projects; (2) for State and local governments, reports of the Bureau of the Census, the Office of Education, etc.; and (3) for private households, the Census of Population and the Current Population Survey of the Bureau of the Census. For further details, see U.S. Office of Business Economics, *National Income: 1954 Edition.*

The earnings figures for 1900–1928 were computed to link to those of the U.S. Department of Commerce national income accounts beginning 1929. Substantial use was made of a wide variety of sources, including special census reports, Simon Kuznets, *National Income and Its Composition, 1919 to 1938*; and Paul Douglas, *Real Wages in the United States, 1890–1926*.

The following summaries from Lebergott's book cover the derivation of estimates for individual industries for the 1900–1928 period:

D 739, agriculture, forestry, and fisheries. For 1910 to 1928, average earnings were computed from estimates of wages of hired labor (including the value of perquisites) and the average employment of such labor. For 1899, the total cost of hired labor as reported in the agriculture census and total employment of hired labor as reported in the population census were used for computing an earnings figure. For 1902, 1906, and 1909, figures were interpolated between 1899 and 1910 averages by the average monthly farm wage rates as derived from the surveys of the USDA.

Analysis by Louis Ducoff indicates the close relationship over the 1910–1943 period between farm wage-rate changes and prices received by farmers. Lebergott therefore used the U.S. Bureau of Labor Statistics wholesale price index component for farm prices for interpolating between the above estimates.

D 740, manufacturing. For manufacturing employees, Lebergott relied on the census of manufactures series for census years, interpolating for the pre-1919 years by the State data as combined by Paul Douglas, and for the post-1919 years by similar data as combined by Simon Kuznets.

D 741, mining, total. The estimates for all mining were computed as the weighted sum of series for anthracite, bituminous, metal, and oil mining for 1902, 1909, and the years 1914 to 1928. For the remaining years in the 1900–1913 period, total mining was estimated from the trend in coal mining, the ratio of one average to the other being much the same in 1902, 1909, and 1914. All mining earnings were 108.5 percent of coal mining in 1914 and 107.8 percent in 1909. For 1902 they were 11.3 percent, a difference explained by the anthracite strike of that year. The 1909 ratio was therefore used for 1900 to 1913.

D 742 and **D 743,** anthracite and bituminous coal. Separate estimates were computed for each industry for the years 1900 to 1928. For 1919 to 1928, the averages can be readily derived from Kuznets' estimates. For earlier years, the census data were interpolated by Paul Douglas on the basis of the relevant State series; his figures were used for extrapolation after some adjustments. For both the anthracite coal strike of 1902 and the bituminous coal strike of 1919, Lebergott followed Douglas in showing a decline in earnings, relating total payrolls to the average number customarily employed in the nonstrike months. Since this decline is also reflected in employment data, the two may not be multiplied together for these years to give total payrolls.

D 744, metal mining. For metal mining, Lebergott interpolated between census benchmark data by the weighted trend of earnings in copper and iron mining. Because the precious metals, lead, and zinc, were mined primarily in the West during this period, the employment weight for these industries was given to the series for copper, which is primarily one for the Mountain States.

D 745, construction. The 1929 Department of Commerce average was extrapolated to 1919 by the implicit full-time earnings figures in the Kuznets' estimates. Lebergott then extrapolated to 1900 by an adjusted index of weekly earnings, using Douglas' series for building tradesmen and for unskilled laborers, and weighting these together by population census weights. To adjust this series for the varying volume of employment from year to year, Lebergott multiplied by an adjustment ratio—computed as the ratio of an index of weekly to one of annual earnings in manufacturing.

D 746–752, transport and utilities. The group average, as those for utilities and for communications, is a weighted average of earnings in individual industry sectors. The weights used were the employment estimates derived above. The average earnings were in general the Department of Commerce 1929 figure extrapolated to 1919 by Kuznets' series, and to 1900 by Douglas' series. There were three partial exceptions to this primary procedure: (1) For gas and electricity, alternative estimates of the 1900 to 1904 trend were made because Douglas' figures, based on Wisconsin reports, show an unreasonable trend; (2) for telephone and telegraph, the 1902 estimate was extrapolated to 1900 by the trend for street-railway earnings, the two showing similar trends in immediately subsequent years; and (3) for water transport, the 1900 to 1918 trend of average weekly earnings of seamen was adjusted to the trend for annual earnings by the ratios of weekly to annual series for earnings on steam railroads.

D 753, wholesale and retail trade. Direct estimates for trade were made, using as basic sources a variety of direct studies of earnings made in the period 1900 to 1919. Benchmark estimates were made for 1900 using the 1901 Cost of Living Survey (of 24,000 families), an 1895–1896 study by the Commissioner of Labor on earnings in the various industries of 30 States, and the 1899 Census of Manufactures. Benchmark estimates for 1909 and 1919 were developed from censuses of manufactures, laundries, and the telephone industry, from a massive 1909 Bureau of Labor study of women's earnings, and from a 1921 study by the National Bureau of Economic Research and the Census Bureau. Interpolations were then made between these benchmark averages.

D 754, finance, insurance, and real estate. Earnings were computed as the weighted sum of earnings in the two major occupational categories, agents and clerical personnel. Estimates of the number of agents who were employees were made from population census data. Average earnings of agents in 1900, 1905, 1910, and 1920 were available for Metropolitan Life Insurance Company agents, the largest company in the field. Interpolation for 1901 to 1904 and 1910 to 1920 was by the movement of earnings in trade. For 1906 to 1909, a linear trend was used to reflect the readjustment of agents' earnings after the Armstrong investigation, leading to a much greater 1905 to 1910 growth than appears in trade earnings.

Unpublished figures on earnings of salaried clerical employees in one of the five largest insurance companies were used for the years 1909 and 1914 to 1919. These were extrapolated to 1900 and interpolated for 1910 to 1913 by the trend in earnings of salaried clerical personnel in manufacturing. The two series thus estimated were combined with employment weights derived from the 1910 census, giving a trend series for 1900 to 1919. This series was used to extrapolate the 1919 to 1929 figures derived from Kuznets' estimates.

D 756, personal services. The first step in developing this series was to make a benchmark earnings estimate for 1900, by estimating averages for key occupations and industries, then weighting them together by the number of employees in each. (Consistent weights were available from the special class-of-worker tabulations from the 1910 census.)

For 1920 and 1921, the results of a Census-National Bureau of Economic Research nationwide survey for the President's Conference on Unemployment were used.

The personal-service earnings figures thus derived for 1900 and 1920, as well as that for 1929 shown in Department of Commerce estimates, are virtually identical with the average earnings in laundries for those years. Therefore, the census of manufactures data on laundry earnings in 1909, 1914, 1919, 1925, and 1927 were used to extrapolate the 1919 service earnings figure to these additional years.

Ratios of personal service earnings to those for trade, a segment for which yearly estimates had already been made and which is similar in certain key respects to that of service, were computed. The ratios were as follows: 1900, 65; 1909, 69; 1914, 67; 1921, 73; 1925, 69; 1927, 70. The relationship appears to be quite reasonable and steady, even to the extent of indicating a relatively greater rise for the lower-paid industry than the higher during World War I and

after—a phenomenon apparent in other series based on very solid annual or biennial reports. These ratios were, therefore, interpolated and applied to the trade series to give the estimates of earnings in personal service.

D 762, State and local government. An initial benchmark for earnings in 1905 was established as follows:

(1) For policemen and firemen, the largest single group, averages of earnings data available for cities of 30,000 and over in population in 1905 were adjusted to apply to all cities on the basis of the ratio of teachers' earnings in larger and smaller cities. (2) For the next largest occupation group, city labor, the 1905 census data for employees of street-cleaning departments were used, after an adjustment similar to that noted for policemen and firemen to make the figures apply to the United States as a whole. (3) For city officials and other city employees, the average for policemen and firemen was used. (4) For State and county officials, the Office of Education data on average earnings of teachers were used since the two were very similar in level during stable periods in the 1920's. (5) In addition, an estimate of the number employed in State mental hospitals and institutions for the feebleminded was prepared as part of the employment estimates. The average salary for this group was assumed the same as that for all hospitals, computed as part of the estimates for service. These five earnings averages were then weighted together by the occupation data for local government in 1910 as shown by the Census of Population.

For 1919 to 1928, Kuznets' estimates based on a review of available reports for individual cities and States were used. The 1905–1919–1928 data show a close similarity of trend to that for the earnings of urban teachers, suggesting that the latter could be used for interpolation. In the critical overlap period of 1919 to 1921, however, the rate of change in teachers' salaries was not proportionate to that for other State employees, salaries of the former lagging behind increases previously granted to other local employees and, in addition, reflecting the impact of heavy postwar enrollments. The procedure used, therefore, was to extrapolate the 1919 estimate to 1916 by the movement of earnings for policemen and firemen in selected cities as estimated by W. I. King, *The National Income and Its Purchasing Power* (1930). The resultant estimate of local government earnings in 1916 was 91 percent of the average salary of urban teachers, a ratio almost identical with the 88 percent implicit in the 1905 figures estimated earlier. By extrapolating and interpolating these percentages and those for 1905 and 1919 and applying them to the urban teachers' salary estimates, the final series for local government was derived.

D 763, public education. For this series, the biennial surveys of the Office of Education provide the basic raw materials. These were developed into consistent estimates by Douglas and Kuznets; their series were used to extrapolate the 1929 Department of Commerce benchmark.

D 764, Federal civilian government. Separate earnings series were derived for postal and for nonpostal civilian employees of the Federal government, the two series being weighted together and then used to interpolate between benchmark estimates for 1899 and 1929. The 1899 benchmark was derived by sampling the complete list of Federal employees and their salaries as recorded in the U.S. *Official Register* for 1899. For 1929, Department of Commerce data were used.

A benchmark estimate for 1899 earnings in postal service was computed by sampling from the *Official Register* for that year, with interpolation between that figure and the implicit Department of Commerce 1929 average by a series for all postal employees. Benchmark averages for all Federal employees outside the postal service were computed for 1899 and 1919 by sampling from the complete list of employees shown in the *Official Register* for those years. The procedure was identical with that used for postal employees. Interpolation from 1899 to 1919 was by the trend of salaries of government employees in the District of Columbia. For 1920 to 1928, Lebergott interpolated between the 1919 figure and Kuznets' 1929 figure.

D 765–778. Average hours and average earnings in manufacturing, in selected nonmanufacturing industries, and for "lower-skilled" labor, 1890–1926.

Source: Paul H. Douglas, *Real Wages in the United States, 1890–1926*, Houghton Mifflin Company, New York, 1930 (copyright).

D765–766 are weighted averages of series D 767 and D 769, and series D 768 and D 770, respectively. The union scales of wages are substantially higher and less flexible than the wages of all workers in the "union" industries. Since the weight of the "union" industries in the all-manufacturing average is based on the total number of skilled and semiskilled workers in the industries, the total manufacturing average is too high (see Leo Wolman, "American Wages," *Quarterly Journal of Economics*, XLVI, 1932, pp. 398–406).

D 767–768, beginning in 1907, are weighted averages of trade union scales for occupations. The weights are union membership by crafts. The series are extrapolated back to 1890 by use of payroll data from the sources of series D 769 and D 770.

D 769–770, average hours and earnings for "payroll" manufacturing industries, are averages weighted by employment data from employer payrolls (see text for series D 794–801), given in various U.S. Bureau of Labor Statistics (BLS) bulletins and in the *Nineteenth Annual Report of the Commissioner of Labor*. Until 1913, the original data are for selected occupations only, and exclude most laborers and some other unskilled workers. Therefore, for 1890–1913, the series are extrapolations backward from the 1914 level.

Differences between series D 767–768 and D 769–770 are not necessarily reliable indicators of differences in wages and hours between workers in union and nonunion industries. Because the biases in series D 767–768 are probably much greater than those in series D 769–770, it may sometimes be desirable to use only the latter to represent all manufacturing.

D 771, average hours (standard) in bituminous coal mining, is estimated from union contracts and their coverage for 1890–1903; after 1903, it is based on data from the U.S. Geological Survey.

D 772, average hourly earnings, was obtained by dividing series D 788, average annual earnings, by average days worked, as reported by the U. S. Geological Survey; the resulting series was divided by daily hours worked.

D 773, average full-time earnings on railroads, is based on average daily wages by occupations, 1895–1914; for 1914–1926, it is based on average hourly wages as reported by the U.S. Interstate Commerce Commission and estimated daily hours.

D 774–775, average hours and earnings in the building trades, were obtained in the same way as series D 767–768.

D 776, average hours for postal employees, is based on nominal hours as set by law, adjusted (after 1920) for sick leave.

D 777, average hourly earnings, is estimated by dividing series D 791 by 52 to obtain weekly earnings and then by dividing again by series D 776 to obtain hourly earnings.

D 778, average full-time weekly earnings for "lower-skilled" labor, is reproduced in the source from Whitney Coombs, *The Wages of Unskilled Labor in Manufacturing Industries in the United States, 1890–1924*, Columbia University Press, New York, 1926, p. 99. It is based on the wages of the least skilled or lowest paid occupations reported for each industry in BLS bulletins and in the *Nineteenth Annual Report of the Commissioner of Labor*, except that the figure for 1920 is based on the data of the National Industrial Conference Board. Since these sources exclude most laborers before 1914, the series is labeled here as "lower skilled," though it is called "unskilled" by Coombs and by Douglas.

D 779–793. Average annual earnings in all and selected industries and in occupations, 1890–1926.

Source: See source for series D 765–778.

D 779–780, all industries averages, are weighted averages of series D 781–793 and an additional series beginning in 1902 for anthracite coal. The weights change annually and are based on decennial

census employment estimates. Interpolations of weights for intercensal years are based on State employment data when available; elsewhere they are linear.

The weights for decennial census years and 1926 are shown in the source, p. 390.

D 781, wage earners in manufacturing, is based on data from the census of manufactures for census years (total wages paid and wage earners). Figures for intercensal years are interpolated using similar data from the labor bureaus of a number of States. Census data for 1890 are adjusted to eliminate the hand trades.

D 782, wage earners in steam railroads, is based on Interstate Commerce Commission data since 1905, and extrapolated back to 1890 using data from several State railroad commissions.

D 783, street railways, is based on the Eleventh Census (1890) and the censuses of electrical industries. Figures for intercensal years are interpolations based on data from several State railroad and public utility commissions and State labor bureaus.

D 784–785, telephone and telegraph industries, are based on censuses of electrical industries. Figures for intercensal years are interpolations based on data published by the Pennsylvania Department of Internal Affairs.

D 786, gas and electricity, is based on the censuses of electrical industries (electricity) and on the censuses of manufactures (gas). Figures for intercensal years are interpolations based on data for New York City, Wisconsin, Illinois, and Pennsylvania, from State sources.

D 787, clerical workers in manufacturing and steam railroads, is based on: Average earnings of salaried workers in manufacturing computed from the censuses of manufactures for census years, with data from three States used to interpolate for other years; and, beginning in 1895, earnings of salaried workers in railroads from the Interstate Commerce Commission, with data from two State railway commissions and one railroad used to extrapolate back to 1890.

D 788, bituminous coal mining, is based on aggregate wage payments from the censuses of mines and quarries of 1889, 1902, 1909, and 1919 as revised in the Fourteenth Census (1920), divided by employment figures reported by the U. S. Geological Survey. Figures for intercensal years are interpolations based on data from the State labor bureaus or departments of mines of five major coal-producing States.

D 789, farm labor, is based on the U.S. Department of Agriculture series of daily wages of farm labor without board and of monthly wages of farm labor without board. Data for 1900–1909 are linear interpolations covering from one to three years each.

D 790, Federal employees, covers employees of Federal executive departments in Washington, D.C., only. The data are from the *Official Register*, adjusted to include bonuses paid during 1917–1924.

D 791, postal employees, covers letter carriers and, beginning in 1906, postal clerks in first and second class post offices. The data are from the *Annual Reports of the Postmaster General*, adjusted to calendar years.

D 792, public school teachers, covers teachers, principals, and supervisors in public elementary and secondary schools. The data are from the *Annual Reports of the U.S. Commissioner of Education*, adjusted to a calendar-year basis. Data for some years after 1915 are interpolations based on studies of the National Education Association.

D 793, ministers, covers salaries of Methodist and Congregational ministers as reported in the *Methodist Year Book* and the *Annual Congregational Gray Book*.

D 794–801. Indexes of wages, hours, and earnings in manufacturing and in the building trades, 1890–1907.

Source: **Series D 794–796**, U.S. Department of Commerce and Labor, *Bulletin of the Bureau of Labor, No. 77*, 1908, p. 7. **Series D 797**, Leo Wolman, "Hours of Work in American Industry," *Bulletin 71*, National Bureau of Economic Research, New York, 1938, p. 2 (copyright).

Beginning in 1900, the Bureau of Labor of the Department of Commerce and Labor undertook, in somewhat modified form, a continuation of the Aldrich reports (see text for series D 735–738). The *Nineteenth Annual Report of the Commissioner of Labor*, 1904, contains the results of the studies for 1890–1903. Somewhat similar surveys were made for 1904–1907 and the information for the entire period was summarized in *Bulletin No. 77*, cited above. The *Nineteenth Annual Report* and the subsequent *Bulletins* (Nos. 59, 65, 71, and 77) show the basic wage, hour, and employment averages for each of the individual occupations and industries and for selected occupations by States and for large cities.

The Bureau of Labor figures, series D 794–796, include the building and other hand and neighborhood trades. Wolman's figures, series D 797, exclude the building and hand trades.

The data in the *Nineteenth Annual Report* are based on information obtained from 3,475 establishments in 67 industries, covering 519 occupations. Agents of the Bureau of Labor collected wages, hours, and employment data separately by occupation and sex from the records of each establishment. Such data were taken only for what were judged principal occupations in each industry and only for the period within each year that was judged "normal" for the establishment. By and large, the basic data for each occupation (separately by sex) were for establishments whose records were complete enough to supply the data for each year 1890–1903.

For 1890–1903, average hourly wages and average full-time weekly hours, weighted by employment, were computed for each occupation, separately by sex. Each of the occupational series was converted to an index number with the average for 1890–1899 as the base. Within each industry, simple arithmetic means of the individual occupational indexes were then computed. Series D 798 and D 800 are unweighted means of the occupational indexes in the building trades. The "all manufacturing" index numbers (series D 794 and D 796), however, are weighted means of the indexes of the 67 separate industries included, each industry weighted by the payroll of that industry as estimated from the 1900 census. Series D 795 is the product of series D 794 and D 796; series D 799 is the product of series D 798 and D 800.

For 1904–1907, the procedures used by the Bureau of Labor were similar to those used for 1890–1903, with the following exceptions: (1) Some small industries covered in 1890–1903 were dropped although the number of establishments covered was increased; and (2) the indexes were chain-linked to those for 1890–1903.

Series D 797 and D 801, for average full-time weekly hours, are based on Wolman's reworking of the basic data for series D 796 and D 800. Series D 797 shows the index numbers computed from the weighted average of the hours figures in the *Nineteenth Annual Report* for 456 occupations in 48 manufacturing industries and excludes the building trades and other hand and neighborhood trades covered in the report. The weight for each occupation in each year is the number of employees covered in the survey of that occupation in the year. Series D 801 is the index number calculated from the similarly weighted average computed by Wolman for the 19 building trades occupations. For the building trades, Wolman expressed the opinion that the hours data in the *Nineteenth Annual Report* were those established by unions.

Wolman's report is a basic source of information of hours of work in American industry. It contains 15 summary tables of historical data on hours of work in manufacturing, building construction, steam railroads, and coal mining for various dates, 1890–1937.

D 802–810. Earnings and hours of production workers in manufacturing, 1909–1970.

Source: U.S. Bureau of Labor Statistics, *Employment and Earnings, United States, 1909–71*, Bulletin No. 1312–8.

The figures for 1909–1931 represent estimates based largely on periodic wage and hour surveys conducted by the Bureau of Labor Statistics (BLS) during that period for a narrow list of manufacturing

industries. These figures are an extension of, and are adjusted for comparability with, the figures for 1932–1957. For a discussion of the methods and data used to derive the figures for 1909–1931, see BLS, *Monthly Labor Review*, July 1955, pp. 801–806.

The estimates of average weekly earnings for 1909–1931, based primarily on census data, tend to be more accurate than those for average hourly earnings and average weekly hours. It is likely that the hourly earnings figures are overstated and the weekly hours understated because the BLS surveys of wages tended to sample large firms more heavily than small firms.

For 1932–1970, the underlying employment, payroll, and man-hour figures were obtained by means of a mail questionnaire sent monthly to cooperating establishments. Each establishment reported the following information: (1) The number of production workers or nonsupervisory employees who worked or received pay for any part of the payroll period which includes the 12th of the month; (2) the total gross payrolls for these employees before such deductions as Social Security taxes, withholding taxes, union dues, etc. (the payroll figures include pay for overtime, shift premiums, sick leave, holidays, vacations, and production bonuses, but exclude payments in kind, retroactive pay, nonproduction bonuses, employer contributions to private welfare funds, insurance and pension plans, and similar fringe payments); and (3) total man-hours paid for these employees including hours paid for vacations, holidays, sick leave, travel time, lunch time, etc.

Within each detailed industry the payroll, employment, and man-hours figures for reporting establishments are aggregated, and average hourly earnings, average weekly hours, and average weekly earnings are computed. The average hourly earnings and average weekly hours for a group of industries are weighted arithmetic means of the corresponding averages for the industries within the group. The weights used for earnings are estimates of aggregate production-worker man-hours and those used for hours are estimates of aggregate production-worker employment. Average weekly earnings for the group is the product of the average hourly earnings and the average weekly hours for the group.

Average weekly hours worked or paid for differ from average full-time or standard hours (before payment at overtime premium rates) and from average hours worked per week. During periods of substantial unemployment, average weekly hours paid for often may be considerably below the full-time level of hours or the level at which premium payments for overtime begin. On the other hand, during periods of relatively full employment, overtime hours tend to raise the average weekly hours above the full-time level.

Until the 1940's, the distinction in most industries between hours paid for and hours actually worked was relatively unimportant. The widespread adoption of paid vacations of increasing length and of an increasing number of paid holidays (and in some industries paid travel time, lunch time, etc.), however, has raised average weekly hours (which are hours paid for) above average hours worked by increasing amounts.

Average hourly earnings figures exclude such fringe payments as employer contributions to private health, welfare, and insurance funds and include premium payments for overtime and for night work.

D 811–813. Earnings and hours for bituminous coal-lignite mining (BLS), 1909–1970.

Source: See source for series D 802–810.

For 1909–1931, estimates are based on a variety of sources including special studies by the BLS and data collected by the Bureau of the Census, the Bureau of Mines, and reports of State coal commissions. For 1932–1970, figures are strictly comparable in concept and method of estimation with those for manufacturing in series D 802–810. See text for same series regarding hours paid for in contrast to hours worked and the exclusion from average hourly earnings of fringe payments which are particularly applicable to coal mining.

Before 1945, lunch time was not paid for in the mines. Beginning April 1945, mine operators paid for 15 minutes of lunch time per day; in July 1947, the lunch time paid for was increased to one-half hour. Similarly, before November 1943, working time was computed on a "face-to-face" basis. From November 1943 to April 1945, inside mine workers were paid for 45 minutes of travel time per day at two-thirds of the regular rate. Since April 1945, inside workers have been paid for all travel time at the applicable hourly rate.

Data published by the Bureau of Mines (*Minerals Yearbook*, 1946, p. 81) show that in 1944 travel time amounted, on the average, to 10–15 percent of total time paid for. Therefore, average weekly hours figures since 1945 may have a serious upward bias if used to measure hours actually worked, and the average hourly earnings figures may have a correspondingly serious downward bias if used to measure average earnings per hour actually worked.

Average hourly earnings figures exclude contributions of coal mine employers to the miners' welfare and retirement fund, established in 1946. This fund was financed by mine operators through contributions of 5 cents for each ton of coal produced. In 1947, the contribution was raised to 10 cents. The medical and hospital fund, previously financed by miners, was combined with the welfare and retirement fund, and the rate of contribution was raised several more times until, in 1952, it reached the current (1970) rate of 40 cents a ton. In 1969, wage supplements in bituminous coal mining, chiefly employer contributions to the welfare and retirement fund, amounted to 20 percent of total compensation.

D 814. Earnings for bituminous coal mining (Lewis), 1890–1957.

Source: H. G. Lewis, *Unionism and Relative Wages in the United States*, pp. 75–76 (© 1963, by The University of Chicago).

In constructing this series, Lewis used the following sources: 1890–1928, Rush V. Greenslade, "The Economic Effects of Collective Bargaining in Bituminous Coal Mining," unpublished Ph. D. dissertation, University of Chicago, 1952, table 8; 1929–1957, Ethel B. Jones, "Hours of Work in the United States, 1900–1957," unpublished Ph. D. dissertation, University of Chicago, 1961, table 2.

Average hourly compensation includes wage supplements.

D 815–817. Earnings and hours for Class I railroads, 1939–1970.

Source: See source for series D 802–810.

Figures for Class I railroads are based on their monthly reports to the Interstate Commerce Commission. Until 1951, the figures covered all hourly rated employees of Class I railroads excluding Class I switching and terminal companies. Since 1951, the figures cover all employees (excluding switching and terminal companies) except executives, officials, and staff assistants. Although the figures since 1951 are not strictly comparable with those for earlier years, the difference is not large.

Average hourly earnings are computed by dividing the total compensation of covered employees by total man-hours paid for. Average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Average weekly hours equal total man-hours paid for (during a month) reduced to a weekly basis, divided by the full-month count of employees on the payroll. The full-month count generally tends to be somewhat larger than a count for the payroll period which includes the 12th of the month and is used for other industries. For this reason both the weekly earnings and the weekly hours figures tend to be slightly lower than they would be if computed on the latter basis.

D 818–829. Indexes of union hourly wage rates and weekly hours, building and printing trades, 1907–1970.

Source: U.S. Bureau of Labor Statistics, *Union Wages and Hours: Building Trades, 1970*, BLS Bulletin No. 1709, pp. 3 and 6; and

Union Wages and Hours: Printing Industry, 1970, BLS Bulletin No. 1707, pp. 3 and 6.

Studies by the Bureau of Labor Statistics of union wage rates and hours prior to 1936 included at various times building and printing trades, barbers, linemen, longshoremen, and workers employed in breweries, laundries, metal trades, millwork, restaurants, soft drink production, theaters, baking, trucking, and local transit. Since 1936, the studies have been confined to the printing and building trades, trucking, local transit, and baking. The baking study was discontinued in 1953.

For each trade, the local union is asked to submit data on the minimum union wage rate, the weekly hours (before overtime becomes effective), and the number of active union members working or available for work on a single specified date (recently July 1) each year.

The earliest studies covered 13 journeymen and 7 helper and labor classifications in building construction, and 7 book and job and 4 newspaper classifications in the printing trades in 39 cities. Since 1964, the studies have covered 24 journeymen and 9 helper and labor classifications in the building trades in 68 cities of over 100,000 population; and 12 book and job and 8 newspaper classifications, and, since 1968, 6 lithographic crafts in the printing trades in 69 such cities.

Indexes for all years were computed by the chain-link relative method, except 1921–1929, which were based on weighted arithmetic means for each year. The figures reflect minimum union contract rates and exclude premium pay for overtime. During periods of unemployment, the contract rates may be higher than the actual wage rates paid. Wage rates above contract rates may be paid during periods of high employment or rapid inflation. Thus, the union figures tend to have smaller cyclical fluctuations than actual wage rates paid to union employees. Furthermore, since overtime pay is excluded, union wage rates fluctuate less cyclically than average hourly earnings.

The hours figures also reflect union contract straight-time hours. They do not measure hours actually worked, which for the building trades vary with climatic conditions and the amount of construction work available.

D 830–844. Earnings and hours of production workers in 25 manufacturing industries, by sex and degree of skill, 1914–1948.

Source: The Conference Board, Inc., *The Economic Almanac for 1950,* New York, 1950, pp. 336–344 (copyright).

The underlying data were collected by the National Industrial Conference Board (NICB) from a sample of companies representing 25 industries (durable and nondurable goods) by means of a monthly mail questionnaire. The number of firms included in the sample, as well as the distribution of these firms by size and geographical location, varied somewhat from time to time. In 1936, the sample included 1,886 firms employing about one-third of all wage earners in the 25 industries covered and about one-fifth of all wage earners in all manufacturing industries. The average firm in the sample (in most of the 25 industries) was substantially larger (in terms of employment) than the average firm in the population from which the sample was taken. Although some tendency toward an upward bias in the level of earnings of the sample firms may exist, it is not clear that this bias also had a trend or varied with the business cycle.

Within each industry, average hourly earnings was obtained by dividing the aggregate payroll for reporting companies by the aggregate man-hours. Average weekly hours and average weekly earnings were obtained in a similar manner. The averages for all industries taken together were weighted means of the separate industry averages with fixed employment weights estimated for each industry with the help of the 1923 Census of Manufactures.

The distinction in classification between unskilled males and other male workers was not precisely stated by NICB and the classification was made by the reporting firms.

D 845–876. Average days in operation per year, average daily hours, and annual and hourly earnings, in manufacturing, by industry, 1889–1914.

Source: Albert Rees, *Real Wages in Manufacturing, 1890–1914,* National Bureau of Economic Research, New York, 1961, Princeton University Press, tables 10 and 13. (Copyright.)

Rees' estimates of hourly earnings of wage earners in all manufacturing begin with estimates of average annual earnings in census years (1889, 1899, 1904, 1909, and 1914 are considered census years). To obtain average annual earnings he divided total wage payments by the average number of wage earners after adjusting the data to conform to the definition of manufacturing in effect for the 1958 census. This meant deducting industries no longer considered manufacturing, the most important of which are railroad repair shop products, with 366,000 workers in 1914, and illuminating gas, with 44,000 workers. The effect of the adjustment was to reduce average annual earnings by $6 in each census year, except in 1889, when it reduced annual earnings by $4.

For 1889, Rees also had to adjust the original census figures to eliminate the hand and custom trades. This adjustment was made for each industry and was based on separate data on factory industries for 1899 given in the *Census of Manufactures* of 1904. When the 1899 data showed that an industry was partly a factory industry and partly a hand or custom trade, Rees applied the 1899 proportions to the 1889 figures.

The nature of the census employment concepts have an important effect on annual earnings figures for census years. The figures Rees would have preferred were total payrolls divided by the number of workers in average daily attendance when the plant was in operation because, at a later step, he divided annual earnings by the number of days in operation to get average daily earnings. The nature of the appropriate average employment concept can be seen more easily by reversing the order of the division: total payrolls divided by days in operation would give average daily payrolls, which, divided by the number of workers in average daily attendance, would give average daily earnings.

The actual census employment figures differ from this ideal in two opposite ways. In 1914 and 1909, employers were asked to report, from time or payroll records, the number of workers employed on the 15th day of each month or the nearest representative day. The employment figures for the 12 months were then added, employment in any month in which the plant was not in operation was counted as zero, and the sum was divided by 12. The first source of error was the inclusion of these zero figures, which resulted in too low an average employment and too high a daily earnings figure. In effect, time lost during whole months in which an establishment was not in operation was counted twice: once in employment and once in the number of days worked. In seasonal industries such as glass, where the error on this account is large, Rees made special corrections to allow for it.

The second source of error was that employers probably included in their count some workers who were on the payroll on the 15th day of the month but were not at work or receiving pay on that day. This source of error resulted in too high an average employment and too low an average daily wage. Checks of the hourly earnings figures against data built up from hourly wage rates did not suggest any consistent bias in the estimates and thus led Rees to conclude that the two sources of error were, in general, roughly offsetting.

Prior to 1909, the census employment concepts were somewhat different. In 1899 and 1904, employers reported average employment for each month without reference to a particular day. In 1889, the average employment concept was essentially average employment during the time the plant was in operation. Thus the first of the two sources of error is absent in 1889, while the second is not. For this reason, the earnings estimates for the early 1890's may be slightly too low.

For the intercensal years, Rees used data for Massachusetts, New

Jersey, and Pennsylvania as interpolators. The Massachusetts series covers the full period, the Pennsylvania series begins in 1892, and the New Jersey series in 1895. He linked the series at these points to prevent the changes in coverage from affecting the movement of the series.

The average number of days per year that establishments were in operation is a weighted average of data for the same States used in interpolating annual earnings. Within each State, Rees computed employment-weighted averages of days in operation by industries; the all-manufacturing averages published by some of the States are weighted by the number of establishments. The weights for combining States in census years were census employment in manufacturing; for other years, linear interpolations of the census weights. The full-time work year during the period 1889–1914 was apparently 312 days—365 minus 52 Sundays and one holiday.

Rees used the series on average full-time hours per day in all manufacturing again in deriving some of his industry data on hourly earnings, referring to it as the "general hours series." Throughout the study he converted weekly hours to daily hours by dividing by six. The daily hours figures for 1914 and 1909 were computed from the frequency distributions of full-time hours per week in the census of manufactures.

From 1903 to 1914 the movement of the "general hours series" was based on U.S. Bureau of Labor Statistics (BLS) data for seven industries, using Douglas' processing for six of them (Paul Douglas, *Real Wages in the United States, 1890–1926*, Boston, 1930). The industries are cotton, silk, hosiery and knit goods, woolen and worsted, boots and shoes, lumber, and iron and steel. These were combined by census employment weights, using linear interpolation of these weights for intercensal years. The resulting series was then adjusted to pass through the points computed from census data for 1909 and 1914.

This segment of the "general hours series" used the hours data for all of Douglas' payroll industries except clothing (for which Douglas interpolated the data for 1907–12) and slaughtering and meat-packing (for which he assumed a constant 60-hour week on the basis of information other than the BLS data). Rees added the silk industry, for which he computed average hours from the BLS bulletins following Douglas' method.

For 1890–1902, the movement of the "general hours series" was taken from Wolman's series for all manufacturing (*Hours of Work in American Industry*, Bulletin 71, NBER, 1938). This was linked to the segment of the general hours series for 1903–09 by means of an overlap of one year at 1903. The resulting change in the level of Wolman's series was an increase of 0.2 hour per week. Wolman's series uses all the hours data for manufacturing in the *Nineteenth Annual Report of the Commissioner of Labor*; it thus has much broader coverage (48 industries) than Douglas' series, which was derived from the same source for this period, but is confined to 14 industries.

Rees' estimates of money earnings for individual industries were derived in essentially the same way as the estimates for all manufacturing. However, he used data from several additional States to estimate the number of days in operation per year and to interpolate annual earnings between census years. These States provided usable data only for some industries or only for short periods of time. See source for additional detail.

The choice of industries was dictated by the availability of State data. None of the State sources provide definitions or descriptions of the industries to which their industry series refer, and the industry titles at times proved quite misleading. Large differences between State and census data in the movement of annual earnings from one census year to the next were often grounds for not using a series. Because it was possible for Rees to combine series given separately in his sources, but not to break them down, the industry coverage of his series is always that of the broadest of their components.

The levels of average daily hours for individual industries for 1909 and 1914 were computed from census data. In two industries, Rees made special assumptions about the means of the open-end classes in the census distributions. For glass, short workweeks were common for part of the work force, apparently because of the heat and physical strain of some jobs. In this industry he assumed that the mean of the weekly-hours class "48 hours and under" was 44 hours. For iron and steel the means of the open-end class "over 72 hours" were computed from BLS data.

The movement of hours, except for the trend from 1909 to 1914, was based ultimately on BLS data, combined in several different ways. In five industries (cotton, woolens, hosiery and knit goods, boots and shoes, and iron and steel) Rees used the Douglas payroll series adjusted to the census levels of 1909 and 1914. For silk, he computed an hours series using Douglas' methods; this was then adjusted to census levels. The hours series for "all textiles" is the weighted averages of the series for cotton, woolen, silk, and hosiery and knit goods, with no new adjustment to census levels. In the remaining industries, except dyeing and finishing textiles, he used the general hours series to estimate the movement of hours from 1903 to 1914, adjusting it to the census levels of each industry. For dyeing and finishing textiles he used the "all textiles" series.

In five industries (dyeing and finishing textiles, leather, paper, glass, and foundries and machine shops) for the period before 1903, Rees used the data for individual industries in the *Nineteenth Annual Report of the Commissioner of Labor*. For the two remaining industries (rubber and electrical machinery) the data in that report covered four establishments or fewer, and were considered too unreliable to use. Therefore, he used the "general hours series" in these industries before 1903 as well as after.

D 877–892. Earnings and hours of construction and non-supervisory workers in selected nonmanufacturing industries, 1932–1970.

Source: See source for series D 802–810.

See also text for series D 802–810.

D 893–904. Average annual supplements to wages and salaries per full-time employee, by major industry, 1929–1970.

Source: Computed from the following: U.S. Office of Business Economics, 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965, Statistical Tables*; 1964–1967, *U.S. National Income and Product Accounts, 1964–1967*; 1968–1970, U.S. Bureau of Economic Analysis, *Survey of Current Business*, July 1971, tables 6.4 and 6.7.

These figures were computed by dividing estimates of aggregate supplements to wages and salaries, by industry, by the corresponding estimates of the aggregate number of full-time equivalent employees. For discussion of estimates of full-time equivalent employees, see text for series D 739–764; for discussion of supplements to wages and salaries, see text for series D 905–912.

D 905–912. Average annual supplements to wages and salaries per full-time equivalent employee, by type of supplement, 1929–1970.

Source: See source for series D 893–904, tables 1.10, 3.8, and 6.4.

These figures were computed by dividing estimates of aggregate supplements to wages and salaries, by type, by estimates of full-time equivalent employees in all industries. For discussion of estimates of full-time equivalent employees, see text for series D 739–764. The source presents figures for a more detailed classification of supplements.

The averages shown for the different types of supplements may tend to be somewhat lower than they should be because the employment figures used to obtain the averages include employees for whom no contributions or payments were made and who would not therefore be recipients of supplemental compensation.

Data for "employer contributions for social insurance," series D 906–909, have a high degree of reliability since they are obtained

almost exclusively from the accounting records of the agencies administering the programs. Estimates for "other labor income," series D 910–912, are less reliable.

Data on supplements to wages and salaries are obtained from a variety of sources. Reports filed by employers with the administrative agencies or with the U.S. Treasury are the sources of figures for employer contributions under old-age and survivors insurance, State unemployment insurance and cash sickness compensation, railroad retirement and unemployment insurance, and the Federal unemployment tax. Payments made by the Federal Government to its civilian employee retirement systems are obtained from U.S. Department of the Treasury records and the records of the administrative agencies. Estimates of Federal Government contributions made to Government life insurance programs are based on monthly reports of the Veterans Administration.

Contributions to State and local retirement systems are based on data supplied, since 1936, by the U.S. Department of Health, Education, and Welfare. Estimates for 1929–1935 are extrapolations from the 1936 figure based on a sample survey of State and local government units.

Estimates of compensation for injuries are based on data in the annual *Insurance Yearbook* (Spectator Company), on reports of State insurance funds, and on information furnished by State accident compensation commissions.

Employer contributions to private pension plans are estimated for 1945–1970 chiefly from tabulations prepared by the Internal Revenue Service. Contributions to health and welfare funds are estimated from data obtained from the Amalgamated Clothing Workers of America, the International Ladies' Garment Workers' Union, the United Mine Workers of America, and the American Telephone and Telegraph Company. Employer contributions for group insurance, series D 911, are based upon studies made by the U.S. Department of Health, Education, and Welfare and upon reports from the Institute of Life Insurance.

Data on the pay of military reservists were obtained from the Armed Services or from the annual *Budget of the United States Government*; data on Federal payments to enemy prisoners of war were obtained from the U.S. Department of Defense. Other items in "other labor income" have always been small in amount.

D 913. Annual salary of college teachers, 1929–1970.

Source: 1929–1952, George J. Stigler, *Trends in Employment in the Service Industries*, Princeton University Press, Princeton, 1956, p. 134, (copyright; reprinted by permission of Princeton University Press). 1956–1970, National Education Association (NEA), Research Report, 1960–R3, 1962-R2, and 1972-R5 (copyright © 1960, 1962, and 1972, respectively, by the National Education Association; all rights reserved).

The figures for 1929–1952 represent the average annual salary of college teachers in large public institutions. The average salary is the weighted arithmetic mean of median salaries estimated separately for the four ranks of instructional staff: Instructors, assistant professors, associate professors, and professors.

For 1929–1932, the median salaries by rank are based on Viva Boothe's *Salaries and the Cost of Living in Twenty-seven State Universities and Colleges, 1913–1932*, Ohio State University Press, 1932. For 1935–1942, 1950, and 1952, Stigler estimated median salaries by rank from data in various reports of the Office of Education. The weights used in calculating the weighted mean of the median salaries by rank were the relative numbers in each of the ranks in public universities, colleges, and professional schools in New York State as shown in annual reports of the University of the State of New York. For 1943–1949, the figures were interpolated by Stigler on the basis of expenditures on resident instruction per teacher.

Figures for 1908–1928 approximately comparable to those shown here and for median salaries for each of the four college teaching ranks for 1908–1942 appear in George J. Stigler, *Employment and Compensation in Education*, National Bureau of Economic Research, New York, 1950.

The NEA figures for 1956–1970 represent median annual salaries for all four ranks of instructional staff engaged in full-time teaching in four-year colleges and institutions. They cover the academic year of nine months—two semesters or three quarters—even when the compensation is paid over a 12-month period. The data exclude salaries paid to part-time employees and to administrative officers regardless of the amount of time they may have spent in teaching.

D 914 and D 917. Annual net income of nonsalaried lawyers, 1929–1954.

Source: U.S. Office of Business Economics, *Survey of Current Business*: 1929–1946, August 1949 issue, p. 18; 1947–1954, December 1956 issue, p. 27.

Nonsalaried lawyers are those who engage in private practice as entrepreneurs. The average shown, series D 914, is the arithmetic mean. Estimates of median net income are presented in series D 917. Net income is excess of gross receipts from legal practice over the total of the payroll, rent, and other costs of legal practice. Part-year incomes have been converted to full-year equivalents.

The estimates are based on a series of sample mail surveys of the legal profession made by the U.S. Department of Commerce. The results of the various surveys are reported in the *Survey of Current Business* for April 1938, August 1943, May 1944, August 1949, July 1952, and December 1956. These reports, particularly those of August 1949 and December 1956, contain the mean and median net income figures shown here and also, for selected years, detailed frequency distributions by size of income for nonsalaried, salaried, and part-salaried lawyers. Tabulations by various other characteristics are also shown.

D 915 and D 918. Annual net income of nonsalaried physicians, 1929–1970.

Source: 1929–1951, U.S. Office of Business Economics, *Survey of Current Business*: 1929–1949, July 1951 issue, p. 16; 1950–1951, July 1952 issue, p. 6. 1959–1970, Medical Economics Co., Oradell, N. J., *Medical Economics*, various issues (copyright © 1959–1970; reprinted by permission).

In the *Survey*, nonsalaried physician is defined as one whose sole source of medical income is from independent practice. The average shown, series D 915, is the arithmetic mean. The 1929–1951 *Survey* estimates of median net income, series D 918, are presented for linkage with the *Medical Economics* data for later years. Net income is the gross receipts from medical practice less the total of payroll, rent, supplies, equipment depreciation, and other expenses of medical practice. Part-year incomes have not been converted to full-year equivalents.

The 1929–1951 estimates of net income are based chiefly on a series of sample mail surveys of the medical profession made by the Department of Commerce. The results of the various surveys are reported in the *Survey of Current Business* for April 1938, October 1943, July 1951, and July 1952. These reports, particularly July 1951, show the mean and median net income figures shown here and also, for selected years, gross incomes and income distributions by size of income for nonsalaried, salaried, and part-salaried physicians. Tabulations by various other characteristics are also shown.

The 1959–1970 *Medical Economics* data in series D 918 relate to self-employed medical doctors under age 65; they represent income from practice after payment of tax-deductible professional expenses but before payment of income taxes.

D 916 and D 919. Annual net income of nonsalaried dentists, 1929–1970.

Source: 1929–1951, U.S. Office of Business Economics, *Survey of Current Business*: 1929–1948, January 1950 issue, p. 9; 1949–1951,

July 1952 issue, p. 6. 1952–1970, American Dental Association, Chicago, Ill., *The . . . Survey of Dental Practice* for the years 1953, 1956, 1959, 1962, 1965, 1968, and 1971 (copyright by the American Dental Association; reprinted by permission).

In the *Survey*, nonsalaried dentists are defined as those who engage in private practice as entrepreneurs. The average shown, series D 916, is the arithmetic mean. The 1929–1951 *Survey* estimates of median net income, series D 919, are presented for linkage with the American Dental Association data for later years. Net income is gross receipts from dental practice less the total of the payroll, rent, and other costs of dental practice. Part-year incomes have not been converted to full-year equivalent incomes.

The estimates of average annual net income are based on a series of sample mail surveys made by the Department of Commerce. The 1938 survey of dental incomes is reported in Herman Lasken, *Economic Conditions in the Dental Profession, 1929–37*, U.S. Department of Commerce, September 1939; the 1942 and 1949 surveys in the *Survey of Current Business*, April 1944 and January 1950, respectively. These reports contain, for selected years, mean and median net and gross incomes and detailed income distributions by size of income not only for nonsalaried dentists but also for salaried and part-salaried dentists. Tabulations by various other characteristics are also shown in the sources.

The 1952–1970 American Dental Association data cover gross income (total collected fees) minus professional expenses. Reports received from dentists who worked only part of the year are included in the survey results. In the source report, the term "independent dentists" is used for 1970 and is defined to include self-employed dentists and dentists who are shareowners of incorporated dental practices. The source states that, for practical purposes, the term "independent dentists" is equivalent to "nonsalaried dentists" used in previous dental practice surveys.

D 920. Median monthly salary rate, engineers, 1929–1970.

Source: 1929–1953, David M. Blank and George J. Stigler, *The Demand and Supply of Scientific Personnel*, National Bureau of Economic Research, New York, 1957, pp. 114 and 116 (copyright); 1956–1970, Engineering Manpower Commission of Engineers Joint Council, *Professional Income of Engineers, 1972*, New York, 1972, p. 13 (copyright).

Blank and Stigler's estimates for 1929, 1932, and 1934 were based on data obtained by the U.S. Bureau of Labor Statistics from a 1935 survey of all professional engineers in the United States who could be located. The survey placed heavy reliance on membership lists of engineering societies for its mailing list. Approximately 173,000 questionnaires were mailed and about one-third were returned with usable data. The estimates for 1939, 1943, and 1946 are for all engineers, both graduate and nongraduate, who were members of the six engineering societies of the Engineers Joint Council in May 1946. The Council obtained income data from a mail questionnaire sent to 87,000 member engineers. Approximately 47,000 questionnaires were returned. The tabulations made by the Council were based on returns from engineers who had maintained residence as civilians in the United States continuously during 1939–1946. The estimate for 1953 is for graduate engineers only and is the monthly equivalent of the annual rate given in the source used by Blank and Stigler. It is based on data obtained by the Engineers Joint Council from a sample survey of graduate engineers employed in industry and government.

Blank and Stigler give not only median monthly salary rates, but also first and third quartile monthly salary rates. In addition, other tables, particularly in appendix A, provide average income data for selected years (in some cases as far back as 1890) for engineers classified by years of experience and engineering specialization.

The data for 1956–1970 relate to salaries paid to graduate engineers 20 years after the baccalaureate degree. The 20-year medians were selected arbitrarily as representative of engineers who had achieved a high level of experience and who were approaching their peak periods of professional activity and earning power. The annual medians shown in the source report were divided by 12 (and rounded to the nearest $10) to represent the monthly equivalent. These figures comprise base salary before deductions plus regular allowances including cost-of-living differential, if any, but not unpredictable payments for overtime work, stock options, etc.

The samples used in the biennial surveys conducted by the Engineering Manpower Commission may not be exactly comparable because of changes in the participating groups. However, according to the source report, the size of the total sample (1,109 establishments covering over 230,000 graduate engineers in 1970, or about 32 percent of all degree-holding engineers) and the consistency with which many companies and agencies have participated throughout the survey series suggest that changes in the composition of the survey group have not materially altered the reported medians.

Salary figures were reported by employers on two questionnaires designed to obtain information on earnings of all employed engineering graduates in both supervisory and nonsupervisory positions. All salary information was reported in relation to the year of baccalureate degree as a measure of experience. The source report gives the U.S. annual medians at 2-year intervals up to 10 years after graduation and at 5-year intervals thereafter, terminating at 30 years after graduation.

D 921–926. Military annual pay rates, 1865–1970.

Source: 1865–1955, The President's Commission on Veterans' Pensions, *Veterans' Benefits in the United States*, vol. I, Staff Report No. IV, p. 79, 1956 (House Committee Print No. 261, 84th Congress, 2d session). 1960, U.S. Department of Defense, Office of the Secretary (based on the President's 1960 budget estimate); 1964 to 1970, U.S. Office of Management and Budget, unpublished data.

These rates are as of June 30 and are based on weighted averages. For enlisted men, basic pay represents only that part of the total compensation which is paid in cash. For officers, basic pay rates are supplemented by cash allowances for quarters and subsistence.

Basic pay plus allowances, series D 924–926, includes the value of quarters, food, and clothing, both in the form of cash allowances to officers and "in kind" to enlisted men. However, it does not include the value of medical care; income tax exemptions; recreational facilities; flight, combat, and other hazardous-duty pays; transportation; Government insurance benefits; etc. The omission of these latter items results in an understatement of the level of military compensation; also, to the extent that these subsidiary items have been introduced in recent years or improved in quality and extent, the upward trend in military compensation is not fully reflected. The data are not strictly comparable from year to year due to changes in coverage of allowances.

D 927–939. Labor union membership, by affiliation, 1935–1970.

Source: **Series D 927–934**, U.S. Bureau of Labor Statistics, *Handbook of Labor Statistics, 1972*, p. 332. **Series D 935–939**, Leo Troy, *Trade Union Membership, 1897–1962*, National Bureau of Economic Research, New York, 1965, p. 8 (copyright).

See also text for series D 940–951.

The following text is excerpted, with minor editorial changes, from the Troy study.

The Committee for Industrial Organization (CIO) was formed in November 1935 by eight unions affiliated with the American Federation of Labor (AFL). The new organization maintained its identity until it merged with the AFL in December 1955 as the American Federation of Labor and Congress of Industrial Organizations (AFL–CIO).

Although there are a variety of ways of defining union membership, Troy adhered, whenever possible, to the definition that only those paying dues to a union or for whom dues are paid to a federation such as the AFL, the CIO, or the AFL–CIO are members. Conse-

quently, to the fullest possible extent, he reported union membership on a dues-paying basis.

This concept of membership has greater precision than some other concepts, but it is not ideal for all purposes. For example, to a union, total membership may include persons paying regular dues, whether in arrears or up to date in their payments; the unemployed, whether or not they pay any dues; those on strike, honorary members, persons in the Armed Forces, and retired, sick, disabled, or inactive persons. All or many of those categories may be regarded and reported by a union as membership in good standing.

Persons holding withdrawal cards are not counted as members in Troy's study. Withdrawal cards show that a member was in good standing when he left the union; therefore he is permitted to apply for reinstatement rather than required to apply as a new member.

For purposes of collective bargaining, a union may report on the number it represents. Typically, representation is larger than membership since it includes persons whom the union represents, but who are not members of the union. However, it also excludes members not in a represented unit and whom the union does include in its count of total membership.

Newly organized units may not be charged dues until a collective bargaining agreement is signed. This may show up as a lag in membership, as Troy measures it, but his count will include the newly organized once an agreement is signed and dues are collected.

For such vital purposes of determining voting rights at conventions, unions allot representation on the basis of membership dues received from locals. Thus, the International Ladies' Garment Workers, while defining a member as in good standing even though no dues are paid for 39 weeks, nevertheless changes its definition to a current dues-paying basis to count members for convention purposes.

For enumeration purposes at conventions, unions rely primarily on the average membership paying full per capita dues. The Steelworkers Union bases convention representation upon the average of the paid and exonerated membership of the local union. The United Automobile Workers allots representation at conventions by the *average* number of monthly per capita taxes paid by the local union to the international union.

For the concept of membership he adopted, Troy wanted to estimate the number of active members regularly paying either full-time or part-time dues, plus those who may temporarily not be required to pay dues because of a strike, unemployment, or other reasons recognized by the union. The method actually used, where dues receipts were available, was to divide the receipts by full-time dues per capita. This method can lead to an underestimate of a union's membership as defined above. Thus, should there be a prolonged strike during which dues are not collected, the estimate will underreport the membership for the period. Furthermore, union reports of dues receipts sometimes include amounts obtained at reduced rates from unemployed, retired, or honorary members, and also include dues paid for only part of a year. But, since the annual total is divided by the full-time rate, the estimate will be less than the total number of individuals who were members at some time during the year, though it will exceed the number who paid a full year's dues.

Two general methods of estimating total union membership have been used by the Bureau of Labor Statistics. Prior to 1951, the BLS derived its series by aggregating reports of the AFL and the CIO, to which were added estimates of independent membership derived from a number of sources. Membership by individual union in the BLS series is therefore not available before 1951. Since 1951, the BLS has compiled an annual series on total membership based primarily on replies of individual unions to biennial questionnaires. BLS figures of membership by union became available in 1951 and thereafter in alternate years beginning in 1954.

Basically, the BLS obtained its data from questionnaires which requested the correspondent union to report the average annual dues-paying membership, but it is likely that what was reported was not dues-paying as defined by Troy. If a union failed to respond, the BLS filled the gap with estimates taken from other sources. Troy relied primarily on financial reports to obtain dues-paying membership but, like the BLS, used other sources when the necessary information was unavailable.

When the two methods of preparing membership figures are compared, the BLS figures are nearly always larger. It appears that the BLS often obtained membership figures that were rounded upward or inflated for prestige or strategic reasons, or that included members exempted from all or part of their dues because of unemployment, retirement, strikes, or other reasons. Representation figures, which include workers who are not members but are represented in collective bargaining by the union, also appear to be reported to the BLS, and these, too, usually exceed actual membership.

Differences in coverage account for only minor discrepancies between the BLS and NBER series. With the exception of one organization added to the BLS list of national unions in 1960, the Truck Drivers, Chauffeurs and Helpers Union of Chicago and Vicinity (membership for 1960 reported by the BLS as 9,770), both series include the same national and international unions. The new addition came too late for inclusion in the NBER series. On the other hand, Troy's totals include estimates for about fifty local and regional independent unions with a membership of about 140,000, and about half of these are not included in the BLS series.

Organizations excluded by the BLS are those which do not meet its definition of a national union. From time to time, a union qualifies or fails to qualify, and as a result is added to or dropped from the BLS directory. For example, the Industrial Trades Union was reported by the BLS as a national union in its directory covering the year 1951 and then dropped from subsequent directories, although the union continued to function. After 1951, it apparently lost contracts with employers outside the State of Rhode Island (where the union is largely concentrated), and did not meet the BLS definition of a national union.

In contrast, once Troy obtained information on a union and had some indication that it continued to function, it was retained in his series. Thus the Industrial Trades Union is included in the NBER series after 1951.

D 940–941. Total union membership, 1897–1934.

Source: See source for series D 942–945.

Series D 940 is the sum of series D 943 and D 945; series D 941 is the sum of series D 944 and D 945.

D 942–945. Unions and membership of American Federation of Labor, and membership in independent or unaffiliated unions, 1897–1934.

Source: *Proceedings*, 65th Convention of the American Federation of Labor (AFL), 1946, p. 43; Lewis L. Lorwin, *The American Federation of Labor*, Brookings Institution, Washington, 1933, p. 488 (copyright); *Proceedings* of the AFL. Conventions of 1897, 1898, and 1933–34; and Leo Wolman, *Ebb and Flow in Trade Unionism*, National Bureau of Economic Research, New York, 1936 (copyright).

D 943 represents "total paid membership of the affiliated national and international organizations and directly chartered trade and federal labor unions" based on "the actual per capita tax" remitted by affiliated unions. Such per capita tax payments can and frequently do cover either fewer or more members than the affiliated union reports in its own statements.

Total membership in series D 944 differs from that in series D 943 because series D 944 uses the direct reports of affiliated unions where available in preference to the membership indicated by per capita tax payments.

D 945, membership of independent and unaffiliated unions, covers national and international unions not affiliated with the AFL. It excludes independent unions that are purely local in character or whose jurisdiction is confined to the employees of a single employer. In most years about half the workers covered by this series were members of the four brotherhoods of workers in the railroad train and

engine service. This series is from Wolman, cited above, pp. 138–139, adjusted in 1929–1934 to include the membership of the Trade Union Unity League. For 1932 and 1934, the membership of the Trade Union Unity League has been interpolated from figures for adjacent years.

For Wolman's estimates of union membership by industry, see series D 952–969. Annual estimates of the membership of individual national and international unions for 1897–1934 may be found in Wolman's book cited above and in his *The Growth of American Trade Unions, 1880–1923*, National Bureau of Economic Research, 1924.

D 946–951. Labor union membership and membership as percent of total labor force and of nonagricultural employment, 1930–1970.

Source: U.S. Bureau of Labor Statistics (BLS), *Handbook of Labor Statistics, 1972*, p. 333.

See also text for series D 940–945.

D 946, total union membership, is a continuation of series D 940. For 1935–1947, the membership of AFL–CIO unions is based on per capita taxes; the membership of independent unions was estimated by BLS from fragmentary data. For 1948, 1949, and 1950, the figure shown is the midpoint of an estimated range of 14 million to 16 million. For 1951 and 1952, the figure shown is the midpoint of an estimated range of 16.5 million to 17 million. These ranges are based on membership data from surveys of national and international unions made by BLS. The level of the series may be more accurate during 1948–1952 than during 1939–1947. Prior to 1947, the series seems to include substantially inflated membership claims of some unions. The year-to-year movement of this series from 1947–1953 and, in particular, the drop in membership from 1947–1948 should not be considered as reliable.

Beginning 1953, estimates are based on biennial surveys of national and international unions. (See BLS *Directory of National and International Labor Unions in the United States*, for odd-numbered years from 1953 to 1971.) The figures also include the members of directly chartered local labor unions affiliated with the AFL–CIO and members of unaffiliated national unions. The *Directory* also gives membership by sex, white-collar occupations, industry, and State, and discusses aspects of union administration and activities.

The 1971 BLS *Directory of National Unions and Employee Associations* included, with its union membership count, members of professional and State employee associations engaging in collective bargaining. Combined union and association membership for 1970 yields (for series D 946) 22,558,000, (D 947) 1,371,000, (D 948) 21,243,000, (D 949) 24.7 percent, (D 950) 70,644,000, and (D 951) 30.1 percent.

D 947, Canadian membership of U.S. unions, is from the Department of Labour of Canada, except for even-numbered years beginning in 1954 which are from the BLS directories as cited.

D 948–949, union membership, excluding Canada, is obtained by subtracting series D 947 from D 946. The year-to-year movement for 1947–1953 is unreliable for the reasons given above for series D 946. A better estimate might be obtained for these years by holding the percentage in series D 951 constant at 34.0 and by applying this figure to series D 950.

D 950, nonagricultural employment. See series D 127–141.

D 951, union membership (excluding Canada) as a percent of employees in nonagricultural establishments is computed from series D 948 and D 950. Wolman (see series D 940–945) has also estimated for three decennial census years the number of trade union members, exclusive of Canada, as a percentage of the total number of nonagricultural employees. These percentages are 9.9 in 1910, 19.4 in 1920, and 10.2 in 1930. The percentage shown for 1930 in series D 951 is larger than the corresponding percentage given by Wolman because his estimated union membership figure, exclusive of Canada (3,190,000), is smaller than that shown in series D 948, and also because his nonagricultural employment estimate (30,247,000), based on census data, is larger than the number of employees in nonagricultural establishments shown in series D 950. Wolman's figure excludes many salaried professional and managerial workers included in series D 950, and includes domestic servants, who are excluded from series D 950.

D 952–969. Labor union membership, by industry, 1897–1934.

Source: Leo Wolman, *Ebb and Flow in Trade Unionism*, National Bureau of Economic Research, New York, 1936, pp. 172–193 (copyright).

These figures were obtained by classifying national and international unions into industrial categories and totaling the membership of the unions in each category in each year.

In the latter part of the period, series D 969, "Miscellaneous," consists largely of two unions, the Firemen and Oilers and the Operating Engineers. The Industrial Workers of the World is included from 1905–1914, and is the largest union in the series for some years. The Horseshoers are important in the early years, declining rapidly in the 1920's. Unions affiliated with the Trade Union Unity League in 1929–1934 are excluded.

Some errors of classification arise when a union has membership in more than one category. For example, the Meat Cutters and Butcher Workmen, classified in food, liquor, and tobacco had many members in retail meat stores; the Operating Engineers, classified as miscellaneous, had many members in building construction. These problems are less important in 1897–1934 than they would be in recent years.

The source gives annual estimates of the percentage distribution of union membership by industrial categories. For 1910, 1920, and 1930, it gives estimates of the percentage of employees organized in each of the industrial categories shown here, and in more detailed categories.

D 970–985. Work stoppages, workers involved, man-days idle, major issues, and average duration, 1881–1970.

Source: U.S. Bureau of Labor Statistics (BLS), *Handbook of Labor Statistics, 1972*.

Work stoppages include strikes and lockouts. A strike is defined as a temporary stoppage of work by a group of employees to express a grievance or to enforce a demand. A lockout is defined as a temporary withholding of work from a group of employees by an employer (or a group of employers) to enforce acceptance of the employer's terms. Most work stoppages are strikes rather than lockouts. Strikes involving fewer than six workers or lasting less than a full shift, strikes of American seamen in foreign ports, and strikes of foreign crews on foreign ships in American ports are excluded.

Figures for workers involved include all workers made idle in the establishment where the stoppage occurs, even though they may not all be participants in the controversy. The figures exclude indirect or secondary idleness in other establishments which suspend or curtail operations because of shortages of materials or services resulting from a stoppage. The number of workers involved is the number on the day of maximum idleness; however, the figures for man-days idle, series D 973, take into account variations in the number idle during the strike and include all days on which work was scheduled.

The duration of stoppages, series D 981, is counted in calendar days rather than working days. Strikes that are never formally settled are considered ended when a majority of vacant jobs are filled, whether by former strikers or by others, or when the establishment affected is permanently closed.

The classification of causes of strikes, series D 978–980 and D 983–985, necessarily lacks precision, since many strikes involve more than one issue. In particular, strikes for union organization often involve demands concerning wages or hours.

In computing the number of workers involved in strikes as a percent of total employment and idleness as a percent of total working time, the following employment figures were used: From 1927 to 1950, all employees were counted, except those in occupations and professions in which little, if any, union organization existed or in which

stoppages rarely, if ever, occurred. From 1951 to 1966, BLS estimates of total employment in nonagricultural establishments, exclusive of government, were used. Beginning in 1967, two measures of employment have been used. One is the former series of nonagricultural employment (exclusive of government), which is used to calculate "private nonfarm" working time. The second measure —working time in the "total economy"—is the BLS estimate of nonagricultural employment (including government) plus agricultural wage and salaried workers. The total economy measure was recomputed to 1939.

Estimated working time is computed by multiplying the average number of workers employed each year by the days worked by most employees during the year. To facilitate comparisons, the private nonfarm series was recalculated for all years beginning with 1950.

Unions are involved in the great majority of work stoppages. In 1970, no union was involved in 95 of 5,716 stoppages, accounting for 7,900 workers of the 3,305,000 involved in work stoppages during the year. For some purposes, therefore, workers involved in strikes as a percent of union membership is a more useful statistic than workers involved as a percent of all workers.

Data for 1881–1886 were first published in the *Third Annual Report of the Commissioner of Labor, 1887*. This report also gives fragmentary information for earlier years. Data for 1887–1894 are given in the *Tenth Annual Report, 1894*; for 1895–1900, in the *Sixteenth Annual Report, 1901*; and for 1900–1905, in the *Twenty-first Annual Report, 1906*. References to strikes and lockouts during 1881–1905 were located by the Bureau of Labor by examination of the daily and trade press. Agents of the Bureau then collected data from the parties involved.

No government agency collected data on work stoppages for 1906–1913. For 1914–1915, BLS collected data on the number of stoppages and major issues. For 1916–1926, the count of stoppages was made from press notices, and questionnaires were sent to determine the number of workers involved. This number was reported for only about two-thirds of the known stoppages.

Methods of compiling the series have been fairly uniform since 1927. Information on the existence of a stoppage is obtained from press clippings from a large number of newspapers throughout the country and from reports from unions, employers, and a number of Federal and State agencies. Improvement in the sources of these "leads," especially through State employment security agencies, increased the number of strikes reported over previous years and the number of workers involved and man-days idle. When the existence of a strike is known, a questionnaire is mailed to the parties reported as involved to obtain data on the number of workers involved, duration, issues, etc. In some instances, field representatives of the BLS call on the parties.

D 986–1021. Work stoppages, by major industry group, 1937–1970.

See text for series D 970–985.

D 1022–1028. Average monthly labor turnover rates in manufacturing, by class of turnover, 1919–1970.

Source: U.S. Bureau of Labor Statistics (BLS), 1919–1929, *Monthly Labor Review*, July 1929, pp. 64–65; 1930–1970, *Employment and Earnings, United States, 1909–1971*, Bulletin 1312-8, table 8.

The figures for 1919–1929 are those of the Metropolitan Life Insurance Company which pioneered in collecting labor turnover data on a regular basis, beginning in January 1926. Subsequently, the Company secured data that enabled it to estimate turnover rates monthly back to January 1919.

The Company obtained its turnover data by means of a mail questionnaire sent monthly to reporting firms. (The sample of reporting firms, 160 in November 1926, had grown to 350 by mid-1929.) Each firm was asked to report each month: (1) The daily average number of employees on the payroll, and the total number of (2) accessions, (3) voluntary quits, (4) discharges, and (5) layoffs during the month. The accession rate for each company was computed by dividing the total number of accessions during the month by the daily average number on the payroll during the month. The composite or average accession rate for all reporting firms was the unweighted median of the accession rates computed for individual firms. The annual average was the arithmetic mean of the 12 monthly median accession rates. Discharges, quits, and layoffs were handled in a similar fashion. (The total separation rate, however, was computed as the sum of the median discharge rate, the median quit rate, and the median layoff rate.)

The figures for 1919–1929 are stated as equivalent annual rates rather than monthly rates. They have been converted in series D 1022–1027 to monthly rates by dividing by 12.

In July 1929, BLS took over the work of the Metropolitan Life Insurance Company. At that time approximately 350 large manufacturers employed 700,000 workers in the sample of reporting firms. Over the years the list of cooperating firms has grown greatly, the amount of industry detail has expanded, and methods of computation have been somewhat changed.

BLS turnover rate estimates are based on reports made monthly on a mail questionnaire by a sample of cooperating firms. In 1970, the sample covered approximately 38,000 establishments in manufacturing employing nearly 10.4 million workers. The reporting firms are considerably larger on the average than all firms within the population sampled. This large-firm bias may cause underestimation of turnover rates. Furthermore, the BLS sample of manufacturing firms and its estimates of turnover for manufacturing exclude printing, publishing, and allied industries (since April 1943); canning and preserving fruits, vegetables, and seafoods; women's and misses' outerwear; and fertilizers. The last three industries tend to have exceptionally high turnover rates seasonally. Plants experiencing work stoppages are excluded.

Each cooperating firm is asked to report each month: (1) Total accessions, (2) new hires, (3) other accessions, (4) total separations, (5) quits, (6) layoffs, (7) discharges, (8) other separations, and (9) the total number of employees who worked or received pay for any part of the payroll period which includes the 12th of the month. Prior to 1940, "miscellaneous" separations were included with "quits." Since January 1943 the labor turnover rates pertain to all employees; before that date the rates were for production workers only. Furthermore, before October 1945 the employment base was the average of the number of employees on the payroll the last day of the preceding month and the last day of the current month. The effect of changing the employment base to the number on the payroll for the period including the 12th of the month was negligible. Layoffs are terminations of employment for more than a week, initiated by management, without prejudice to the worker. Discharges are terminations of employment by management for cause (incompetence, laziness, etc.). Quits are terminations of employment initiated by employees; they include unauthorized absences of more than a week. Miscellaneous separations are terminations of employment for military duty of over 30 days and separations other than those itemized (deaths, retirements, etc.).

D 1029. Work-injury frequency rates in manufacturing, 1926–1970.

Source: U.S. Bureau of Labor Statistics (BLS), 1926–1949 and 1958–1970, *Handbook of Labor Statistics*, 1950 and 1972 editions; 1950–1952, *Work Injuries in the United States, 1950*, and subsequent annual issues; 1953–1957, U.S. Department of Labor, news releases.

The Bureau of Labor Statistics' first continuing compilation of injury-rate statistics began in 1910 for the iron and steel industry. In 1925, the injury-rate compilations were expanded to cover 24 industries. In 1952, the compilations covered over 200 manufacturing

and nonmanufacturing industry classifications. At present (1970) the survey provides injury-frequency rates for 490 manufacturing and 180 nonmanufacturing categories.

Efforts to standardize the compilation of work-injury statistics were initiated by BLS in 1911 and resulted in 1920 in the first standardized procedures. In 1926, the American Engineering Standards Committee, later the American Standards Association, undertook a revision of these procedures. Their work led to the publication in 1937 of the first American Standard Method of Compiling Industrial Injury Rates. This standard was revised in 1954 and again in 1967.

The standard injury-frequency rate is the average number of disabling injuries per million man-hours worked. A disabling injury is an injury incurred in the course of and arising out of employment, which results in death or permanent physical impairment, or renders the injured person unable to perform any regularly established job, open and available to him, during the entire time interval corresponding to the hours of his regular shift on one or more days after the injury.

The BLS annual injury-rate estimates are based on a sample mail survey conducted once a year. Cooperating firms are asked to report for all employees (1) average employment, (2) aggregate man-hours worked by all employees, (3) aggregate number of disabling work injuries by extent of disability, and (4) time lost because of disabilities. The manufacturing sample covers approximately 50,000 establishments. The injury-rate series for manufacturing excludes petroleum refining, smelting and refining of nonferrous metals, cement and lime manufacturing, and coke production, which are covered in similar surveys conducted by the Bureau of Mines (see text for series D 1030–1034).

Prior to 1936, the data in series D 1029 are based on surveys covering only wage earners in 30 manufacturing industries. Since 1936 the data refer to all employees in all manufacturing industries. Separate injury-frequency rates have been computed since 1936 for component industries by dividing aggregate injuries by aggregate man-hours in reporting establishments. In computing the average rate for all manufacturing the separate averages for the component industries are weighted by estimated total employment in these industries. Before 1936 the weights implicitly were aggregate man-hours in the reporting firms in each industry.

D 1030–1034. Work-injury frequency rates in mining, 1924–1970.

Source: U.S. Bureau of Mines, *Minerals Yearbook*, 1970, and earlier annual issues.

Except for coal mining since 1941, the Bureau of Mines estimates of work-injury frequency rates in "mining" industries are based on reports made voluntarily by mining establishments. Coal mining firms since 1941 have been obliged by Federal law to report work-injury and related data to the Bureau of Mines.

D 1035–1036. Work-injury frequency rates on Class I railroads, 1922–1970.

Source: U.S. Federal Railroad Administration (prior to 1966, Interstate Commerce Commission), *Accident Bulletin*, various issues.

Both series exclude work injuries suffered by employees of Class I switching and terminal companies after 1932. They are based on monthly accident reports that the Class I railroads are required by Federal law to make to the Federal Railroad Administration. The two series thus result from essentially complete censuses of man-hours worked and of reportable work injuries.

Before 1936 a reportable work-injury was either a fatality or a nonfatal injury to an employee "sufficient to incapacitate him from performing his ordinary duties for more than 3 days in the aggregate in the 10 days immediately following the accident." Series D 1036 includes only such work-injuries. From 1936 through 1956, the railroads were required to report work injuries incapacitating employees for 1–3 days immediately following an accident as well as more serious injuries. Series D 1035 is series D 1036 plus the average work-injury frequency rate for "1–3 day" injuries.

In an effort to narrow the field of reportable accidents while conforming with the intent of the Accident Reports Act, significant changes, affecting the reportability of certain types of railroad accidents, were made in Rules Governing Monthly Reports of Railroad Accidents, effective January 1, 1957. Minor revisions of these rules have been made from time-to-time. Therefore, data for accidents occurring prior to 1957 are not necessarily comparable with those for later years.

The concept of "disabling injury" underlying series D 1029–1034 is essentially the same as that underlying series D 1035. Series D 1036, which excludes "1–3 day" injuries, is not comparable to series D 1029–1034 in level, and series D 1035 also tends to have a downward bias in trend relative to series D 1029–1034. It has been included to indicate at least crudely the trend in the average injury-frequency rates on Class I railroads before 1936.

Both series cover all employees of Class I railroads. The man-hour base of both series is the aggregate number of straight-time hours actually worked and overtime hours paid for in millions of man-hours. Days worked by daily-rated employees have been converted to man-hours worked by multiplying days worked by 8. The average injury-frequency rate is the ratio of the aggregate number of work-injuries to the man-hour base.

★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States*, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract*, see Appendix I in the *Abstract*.

Series D 683–688. Indexes of Employee Output (NBER): 1869 to 1969

[NBER = National Bureau of Economic Research]

Year	1958=100				1958 dollars	
	Output per man-hour [1]	Nonfarm output per man-hour [2]	Manufacturing output per man-hour	Farm output per man-hour	Output per employee [3]	Output per person engaged [4]
	683	684	685	686	687	688
1969	136.4	----------	145.7	177.5	----------	----------
1968	135.3	----------	142.0	164.6	----------	----------
1967	131.3	----------	135.0	163.5	----------	----------
1966	129.5	127.1	134.2	149.4	$9,190	$9,435
1965	125.7	123.8	131.0	144.2	8,930	9,190

[1] Data relate to production workers.
[2] Hours and earnings based upon monthly data and relate to all employees except executives, officials, and staff assistants. For 1939–1955, data for railroads with operating revenues of $4 million or more; 1956–1964, $3 million or more; thereafter, $5 million or more.
[3] 11-month average.

Series D 818–829. Indexes of Union Hourly Wage Rates and Weekly Hours, Building and Printing Trades: 1907 to 1970

* Denotes first year for which figures include Alaska and Hawaii.

[1] Beginning 1947, data cover both on-site and off-site workers on both private and public projects; prior to 1947, they refer only to on-site workers on privately financed construction.

[2] Beginning 1947, includes eating and drinking places.

[3] Beginning 1947, includes only companies engaged exclusively in producing and distributing electricity; prior to 1947, includes combined gas and electric utilities whose income results primarily from sale of electricity.

[4] Excludes nonoffice salemen.

[5] Beginning 1947, data are for "insurance carriers"; prior to 1947, for "insurance."

* Denotes first year for which figures include Alaska and Hawaii.
[1] Beginning 1956, represents median salaries. For salary data for public elementary and secondary instructional staff, see series H 524.
[2] The 1953 figure comparable with data for later years is $646.
[3] For all dentists rather than for nonsalaried only. However, the differences are probably quite minor; they amount to less than 1 percent in 1937 and 1948.

Series D 927–939. Labor Union Membership, by Affiliation: 1935 to 1970

* Denotes first year for which figures include Alaska and Hawaii.

[1] For 1881–1927 and 1947–1970, data for stoppages beginning in calendar years; 1928–1946, data for those ending in calendar years.

[2] Beginning 1961, other contractual matters included under "Other and not reported" rather than "Wages and hours" as in previous years.

[3] Wages and hours were important issues in many of these stoppages also.

[1] Excludes petroleum refining, smelting and refining of nonferrous metals, cement and lime manufacturing, and coke production.
[2] Includes data on coal-mine mechanical-cleaning plants and mill data for metal, nonmetal, and stone quarries. Excludes coke production.
[3] Copper, gold-silver, iron, lead-zinc, uranium, and miscellaneous.
[4] Clay-shale, gypsum, phosphate rock, potash, salt, sulfur, and miscellaneous.
[5] Cement, granite, lime, limestone, marble, sandstone, slate, traprock, and miscellaneous.
[6] Industry definition revised to conform to the 1957 edition of the *Standard Industrial Classification Manual*. Comparisons to prior years should be made with caution.
[7] Beginning 1958, includes data on sand and gravel operations.
[8] Beginning 1957, accidents reported on different basis; data not comparable with prior years.

Chapter E

Prices and Price Indexes

E **1-214.** General note.

An early interest in the statistics of prices was evident at the beginning of the 19th century, with the appearance in 1806 of Samuel Blodgett, Jr.'s *Economica: A Statistical Manual for the United States of America,* which included a collection of prices for 16 important commodities in 5 markets for 1785–1805. Many other contemporary accounts contained references to prices, but the first serious attempt to summarize comprehensive price data for the United States in the form of index numbers was made by Horatio C. Burchard, Director of the Mint. His report to the Secretary of the Treasury in 1881 contained wholesale prices for many individual articles and an index number (which contains some serious inadequacies). In 1886, a special report containing retail prices of about 60 "necessaries of life" was included in volume 20 of the Tenth Census, *Report on the Statistics of Wages in Manufacturing Industries,* by Joseph D. Weeks (usually called the *Weeks Report).* No summary figures were included in this volume.

In 1891, a Senate Resolution led to the collection of a voluminous body of data which covered wholesale prices for 1840–1891 and retail prices for a 28-month period ending September 1891, for more than 200 commodities. The information assembled was summarized by Roland P. Falkner, whose indexes have been widely used as evidence of price changes for 1840–1891. These indexes were prepared as estimates of changes in wage earners' cost of living, but, in actuality, they were indexes of wholesale prices for one month of each year. Their technical adequacy was the subject of considerable controversy at the time, but the deficiencies in the indexes do not detract from the historical value of the basic price data collected for the Senate Committee and published in the "Aldrich Reports," including *Wholesale Prices, Wages, and Transportation* (4 parts), Senate Report No. 1394, 1893, and *Retail Prices and Wuges* (3 parts), Senate Report No. 986, 1592.

In 1900, Roland Falkner extended his indexes to 1899 with quotations for 142 articles collected by the Department of Labor, with some adjustments in his methods. The results are published in Department of Labor Bulletin No. 27, *Wholesale* Prices: 1890 *to* 1899, pp. 237–313. In 1902, the Department of Labor began publication of its index of wholesale prices, which has continued since without interruption.

Interest in price measurements following the upturn in prices after 1897 led to the preparation of a number of wholesale price indexes for the United States, in addition to the official Department of Labor index series. John R. Commons published an index of wholesale prices of 66 commodities for 1878–1900 in the *Quarterly Bulletin* of *the Bureau* of *Economic Research* for July and October 1900. Bradstreet's indexes of wholesale prices of about 96 commodities were established in 1897 and carried back to 1890. Dun's index numbers of wholesale prices for about 350 commodities were published in *Dun's Review* on a continuous basis beginning in 1901 and gradually extended back to 1860. These last **2** series were expressed as sums of actual prices rather than in the conventional index number form. Several other relatively short-lived series were also compiled during the next 10 to 20 years.

After 1902, when the Department of Labor's wholesale price index was continuously available, additions to wholesale price index numbers were mainly to obtain a better historical perspective. In 1932, the series of wholesale price indexes for 1720–1932 were completed by G. F. Warren and F. A. Pearson (see series E 52–63). Part of this work was done under the auspices of the International Scientific Committee on Price History referred to below.

Walter B. Smith and Arthur H. Cole computed wholesale commodity price indexes covering 1792–1862 for *Fluctuations in American Business, 1790–1860,* Harvard Economic Studies, Harvard University Press, Cambridge, 1935. The series include wholesale commodity price indexes for Boston, 1792–1820; for Boston, New York, and Philadelphia, 1815–1845; and New York (primarily), 1843–1862.

Wholesale prices in Cincinnati were assembled from newspapers for 1844–1914 and an index published by Henry E. White in *Wholesale Prices at Cincinnati and New York,* Cornell University Agricultural Experiment Station, *Memoir* 182, Ithaca, 1935.

The most extensive historical price investigations, however, were undertaken under the auspices of the International Scientific Committee on Price History. The results for 6 important marketing centers were summarized by Arthur H. Cole in *Wholesale Commodity Prices in the United States, 1700–1861,* Harvard University Press, Cambridge, 1938. The historical indexes are given in series E 90–122.

Wholesale price indexes were compiled by Frederick C. Mills for commodities grouped according to economically significant factors. Mills' studies of price relationships and price movements contain a number of special indexes which he derived by recombining price relatives for commodities in the Bureau of Labor Statistics (BLS) indexes. These indexes include some special commodity groupings not used by BLS, e.g., crops, as well as classifications by stage of processing and by durability. Some series were first published by the National Bureau of Economic Research (NBER) for 1890–1931 in *Economic Tendencies in the United States,* No. 21, New York, 1932, pp. 584–588. Additional indexes for 1913–1935 appeared in *Prices in Recession and Recovery,* NBER, No. 31, New York, 1936, pp. 491–547. Indexes through June 1943 were included in an appendix to *Prices in a War Economy,* NBER, Occasional Paper No. 12, October 1943, and through March 1948 in *The Structure* of Postwar *Prices,* NBER, Occasional Paper No. 27, July 1948.

The volume of information available for wholesale prices is not matched at the retail level, especially for the early years. The official Consumer Price Index of the BLS was initiated in 1904 with a food index. The *Eighteenth Annual Report of the Commissioner* of *Labor, 1903: Cost* of **Living** *and Retail Prices* of *Food* contained an index of retail prices of food for 1890–1903 weighted by family consumption in 1901. This food index was continued until the end of World War **I,** when it became one component group of a comprehensive "cost-of-living" index, originated as part of a study of cost of living in shipbuilding cities in 1918 and 1919. Supplementary price information had been collected by the BLS over the years, and a comprehensive index was compiled back to 1913. Since World War I, the index has undergone a number of changes in coverage and methodology, most of them in the direction of improvement in the quantity and quality of data. At present, the index is issued monthly under the official title Consumer Price Index, in brief press releases, in detailed reports, and in the *Monthly Labor Review* (see text for series E 135–173).

The National Industrial Conference Board also compiled a Consumer Price Index from 1918 to 1968, This index **was** similar to the BLS Consumer Price Index but the collection of data was primarily by mail instead of by personal visit. **A** description of the NICB index as it was compiled before discontinuance is included in the August 1954 issue of *Management Record.*

The index numbers of prices received and paid by farmers compiled by the Department of Agriculture were also initiated after World War I; see chapter K, series K 344–353.

. Prior to 1913, except for the data in the *Weeks Report* and the *Aldrich Reports,* readily available retail price data are extremely spotty and inadequate. As a result, many of the indexes widely used to approximate changes in retail prices, rest entirely or partially on changes in wholesale prices, A serious limitation in these indexes is that allowance was not made for the slow-moving rents and services nor was account always taken of the difference in movement between wholesale and retail prices of commodities. Falkner's indexes referred to above, for example, were calculated entirely from wholesale price information. Adjustments to wholesale price movements combined with available BLS retail prices formed the basis for Douglas' index of the cost of living (series E 185). The only "cost-of-living" indexes now available for any years before 1913, computed from retail price data, are Wesley C. Mitchell's *Relative Cost of Living for 1860 to 1880,* the *Consumer Price Index for 1851 to 1880* compiled by Ethel Hoover (series E 174–182), and Rees' cost-of-living index, 1890–1914 (series E 186). The cost-of-living index computed by Wesley C. Mitchell for *Gold, Prices, and Wages Under the Greenback Standard,* University of California Publications in Economics, vol. 1, Berkeley, March 1908, p. 91, utilized a portion of the retail data in the *Weeks Report* for *1860–1880.* The Mitchell series was included as one of the links in the cost-of-living index estimate of the Federal Reserve Bank of New York (series E 183). The Hoover Consumer Price Index for 1851–1880 was based largely on a summarization of all of the usable retail price information from the *Weeks Report,* with some additions from other sources. The Rees' cost-of-living index utilized some components of the Douglas' index, but most of the data were compiled from mail-order catalogs, newspapers, and other sources.

Over the years there has been considerable improvement in the quality of the price reporting, in the scope of the data, and in the construction of index numbers. The lists of commodities that are now included in the price collection program cover a wider range of goods in the market, and services are represented in the consumer price indexes. Commodities and services are now defined fairly precisely and the current collection methods give the opportunity of securing supplementary data on discounts, terms of delivery, and other necessary information to measure price change. Data for weighting systems for index numbers can now be taken from the greatly improved expenditure studies, censuses, and other official statistics.

As the indexes and price reports were extended to earlier years, many of these advantages making for better price measures were not present. The range of commodities and services for which information could be obtained from surviving records was very limited. At the wholesale level, the commodity coverage was limited primarily to raw materials and goods in the early stages of processing. The limited coverage of finished goods, especially after the Civil War, is an important factor in the interpretation of price changes. At retail, the available price data were relatively scant and the emphasis was on food and dry goods prices, with little information for other less important commodities and for rents and services. The perennial problem of changes in qualities, changes in consumer tastes, and demographic and other changes which are still present to some extent in the current indexes, become accentuated as price comparisons are made over longer periods of time.

The newspapers and other sources from which prices were assembled for the early years give only brief or vague descriptions for the commodities quoted and the compiler could not always be assured that quotations over time were for the same quality. Incomplete files, nominal prices, and nonpublication in some issues were among the many other problems encountered. Data obtained from records of surviving firms raise the further question of how well these surviving firms represented the movement of prices for all firms for the period under consideration.

E 1–22. Implicit price deflators for gross national product, **1929–1970.**

Source: 1929–1963, U.S. Office of Business Economics, *The National Income and Product Accounts of the United States, 1929–1965;* 1964–1967, *U.S. National Income and Product Accounts, 1964–67,* tables 8.1 and 8.4; 1968–1970, **U.S.** Bureau of Economic Analysis, *Survey of Current Business,* July 1972, tables 8.1 and 8.4.

The implicit defiator for total gross national product (GNP) is the ratio of GNP in current prices to GNP in constant prices. It is a weighted average of the price indexes used to deflate the components of GNP; the implicit weights are expenditures in the current period valued in prices of the base year 1958. The implicit deflator measures the price change of a particular "market basket" since 1958. However, the market basket for any other period is not necessarily the same as for the base year 1958. Consequently, a comparison of the deflator for the current period with any period other than the base year measures both the effect of the difference between the weights in the two periods and the change in the price of a fixed market basket.

The deflation is not performed at the level of individual commodities: components that encompass expenditures on an array of commodities are deflated. On a quarterly basis, 142 components of GNP are deflated as shown below.

Gross national product	142
Personal consumption expenditures	41
Private fixed investment	42
Change in business inventories	10
Exports	3
Imports	3
Government purchases of goods and services	43

The components are deflated with conventional, fixed weighted price indexes that combine price relatives for individual types of commodities included in the expenditure component. Therefore, the implicit deflator involves current period weighting among the component price indexes, and fixed weighting within the components.

Differences between changes in the implicit deflator and the fixed weighted indexes are due to the shift in the weights in the implicit deflator. If the composition of expenditures shifts toward those components that have increased in price at an above-average rate since the price base period of 1958, the implicit deflator increases more than a fixed weighted index. If the composition shifts in the other direction, the implicit defiator increases less than a fixed weighted index.

Strictly speaking, the implicit deflator increases more (less) than a fixed weighted price index that has as its weight base the initial or terminal period of the span being compared if there is a positive (negative) correlation between the shifts in the weights in the implicit deflator and the changes since 1958 in the component price indexes. When the fixed weighted index has another period as its weight base, the difference also depends on the shift in the composition of real GNP between the weight base period and the initial or terminal period of the span being compared.

E 23–122. General note.

Wholesale price indexes are compiled from prices in primary markets; that is, prices pertaining to the first major commercial transaction for each commodity. The quotations are usually selling prices of manufacturers or producers. A few prices are reported by trade associations and organized exchanges, and some are taken from trade publications or from other Government agencies which collect quotations as part of their regular work. They are not prices received by wholesalers, distributors, or jobbers.

In addition to the indexes presented here, brief descriptions of the coverage and calculation techniques for other indexes may be found in G. F. Warren and F. A. Pearson, *Wholesale Prices for 213 Years, 1720–1932,* Cornell University Agricultural Experiment Station, *Memoir 142,* Ithaca, 1932, pp. 167–196; and in BLS Bulletin No. **284,** *Index Numbers of Wholesale Prices in the United States and Foreign*

Countries, 1921, pp. 115–175. This bulletin also contains Wesley C. Mitchell's "The Making and Using of Index Numbers."

See also general note for series E 1–214.

E 23–39. Wholesale price indexes **(BLS), by** major product groups, 1890–1970.

Source: U.S. Bureau of Labor Statistics, *Handbook* of *Labor Statistics*, 2971, Bulletin 1705, p. 276.

The current BLS wholesale price indexes were begun in 1952 but calculated to 1947, using new samples of items and new weights. However, the official index begins with January 1952, and does not replace the 1926 base series as the official index for 1947–1951. The new series of indexes was spliced to the former series (converted) by linking as of January 1947. The former group indexes were spliced with the new ones when the value aggregate of commodities in the former group represented 50 percent or more of the value of shipments in 1947 for all commodities (priced and unpriced) in the group. The index has been shown with 1967 as the base year since 1971. Prior to 1971, the 1957–59 period was the base from 1962 and the 1947–49 period from 1952 to 1961.

With the revision in 1952, the conceptual definition of the index was not altered, but major changes in coverage and methods were adopted. The list of priced commodities was expanded from 947 to approximately 1,800, embracing nearly 5,000 separate series. By 1970, the sample of priced commodities numbered approximately 2,450 and the number of separate price series totaled 7,725. The classification scheme in effect from 1952 to 1970 was revised somewhat in January 1967, providing a more meaningful and flexible structure without changing the basic concept of the structure. The 1967 scheme substituted an 8-digit coding system for the former 6- and 7-digit system permitting a number of special group indexes to be included in the regular classification of the index.

The weighting factors for each commodity represent the value of shipments for the specific commodity priced and for all others in the same group which are known (or assumed) to have price movements similar to those for the commodity priced. By this method of weighting, values for all commodities in a group are accounted for and the group automatically has its proper representation in the all-commodities index. The weight universe includes the net selling value of all commodities included in the producing and processing sector of the economy *including* sales for exports and imports for consumption but *excluding* interplant transfers, military goods, construction, real estate, transportation, securities, printing and publishing, and transactions for services.

The indexes are calculated as averages of relatives weighted by values of shipments. This is algebraically equivalent to quantity weighted aggregative indexes but allows for more flexibility in processing. As in all the official indexes, the linking process is used when there are changes in lists of commodities, changes in weighting factors, or other changes making for noncomparability. In the case of quality changes, adjustments are made to obtain month-to-month relatives for the same quality insofar as possible. If the change in description is minor, direct comparisons are made between the price of the old and the new items. For major quality changes, efforts are made to secure from the producer an estimate of the proportion of the gross price change due to quality differences and to a price change. When such information cannot be obtained, the new quality is linked into the index, thus assuming that the full price change is due to quality change.

Since the revised index was initiated in 1952, there have been four changes in the weighting factors. Value of shipments in 1952 and 1953 were introduced in 1955 and only relatively minor changes were made in the list of items priced. Another revision in the weighting factors to represent value of shipments in 1954 was introduced beginning 1958. Other revisions include introduction of 1958 value of shipments in 1961 and 1963 values in 1967. Policy has been to revise the weighting structure of the index periodically when data from industrial censuses become available, generally at 5-year intervals.

Most of the prices in the index are collected by mail directly from the manufacturer or other producer. A few are reported by trade associations or organized exchanges and some are obtained from authoritative trade publications or from other government agencies that collect price data for their regular work.

The indexes shown here are annual averages of monthly figures. Before 1952, the monthly prices used were averages of 1-day-a-week prices. From 1952 to 1966, prices were, for the most part, those of Tuesday of the week including the 15th of the month. From 1967 to 1970, the pricing date was Tuesday of the week including the 13th of the month. However, for some commodities another day may have been used as a more representative day.

Whenever possible, prices are obtained at the production point or at the central marketing point. Delivered prices are used only when it is the practice of the industry to quote prices on this basis. Prices obtained from manufacturers or other producers are subject to the applicable trade and quantity discounts. Cash discounts are deducted from the price when it is determined that most buyers avail themselves of the reduced prices. Excise taxes are excluded from the price. Closeout sales prices are usually not used. Free deals or allowances are used when possible in arriving at the net price to be used for index calculation. Nominal prices are used when they are indicative of the market situation and no other price is available.

For a more complete description of techniques used in compiling the index, see BLS Bulletin No. 1458, *Handbook* of *Methods for Surveys and Studies*, 1966, chap. *11*.

E 40–51. Wholesale price indexes **(BLS), by major** product groups, 1890–1951.

Source: 1890–1950, BLS, *Handbook* of *Labor Statistics*, 1950 edition, p. 118; 1951, 1951 supplement to the *Handbook*, p. 42.

Since 1902, when BLS began regular publication of wholesale price indexes, there have been a number of changes in lists of items, weighting factors, base periods, and methods of computing the indexes. Detailed descriptions of the early unweighted index numbers, and later the weighted indexes, are included in various annual bulletins on wholesale prices beginning with the Bulletin No. 39, issued in March 1902. The figures shown in series E **40–51** are weighted index numbers of the fixed base weighted aggregative type.

In 1914, BLS recalculated its series back to 1890 using as weights the quantity of each priced item marketed in 1909 but retained the base 1890–99. The system of classification for group indexes was generally according to origin rather than end use and each commodity was included in only one group index. For 1914–1921, the index series were continued with little change except for expanding the list of priced items and rebasing the indexes several times. In 1920 the year 1913 was adopted as the base period in order to provide a prewar standard for measuring price changes.

In 1921, a revision of the indexes extended the commodity coverage to include about 400 items as compared with 280 to 325 in previous years. The weighting factors were changed to represent the quantity of each priced item marketed in 1919. At this time an important change was made in the method of grouping commodities. Articles properly classified in more than one major group were included in the appropriate groups with their total weights but, in the all-commodities index, the weights for such articles were counted only once. In addition, a rearrangement of commodities within groups was made to provide separate indexes for 37 subgroups.

When the 1926 base period was adopted in 1927, the indexes were recalculated back to 1913 with new sets of weights (see **BLS** Bulletin No. 473, *Wholesale Prices*, 1913 *to* 1927, pp. 2–5). The figures for 1890–1912 were converted, not recalculated in detail.

In subsequent years, the weighting factors were brought up to date from time to time. Major additions to the lists of priced items in 1931 and again in 1940 provided better coverage of manufactured articles than in earlier indexes. By 1951, when these indexes were

discontinued, the number of subgroups for which separate series were available had been enlarged to 49. The indexes shown here are annual averages of monthly figures.

Because of changes in the list of commodities and in the weighting factors, the indexes were calculated by the chain relative method. In this way, comparisons between any two periods were based on the same commodities with the same weights. Throughout the whole period, the weight used for each priced commodity was the quantity marketed for that class of commodity. Classes of commodities not represented by an item in the list priced were not represented in the weighting factors.

Table I contains a summary of the number of commodities and the weights used for the indexes in series E 40.

Table I. Number of Price Series and Weighting Factors Used in BLS Wholesale Price Index (All Commodities, Series E 40): 1890 to 1951

Year	Number of series	Weights used
1949–1951	900–947	Quantities marketed 1929 and 1931
1940–1948	881–890	
1938–1939	313	
1934–1937	734	
1932–1933	784	Quantities marketed 1927 and 1929
1931	784	Quantities marketed 1925 and 1927
1930	550	
1926–1929	404–550	Quantities marketed 1923 and 1925
1924–1925	526–523	
1922–1923	450–478	Quantities marketed 1921 and 1923
1920–1921	890–450	Quantities marketed 1919 and 1921
1914–1919	296–871	Quantities marketed 1914 and 1919
1913	252	Quantities marketed 1909 and 1914
1890–1912	251–261	Quantities marketed 1909

The price quotations on which the indexes were based were obtained by mail from leading manufacturers or selling agents or from such other sources as standard trade publications, reports of boards of trade, and produce exchanges. Before 1913, most of the data referred to the New York market, but after 1913, quotations were obtained in several major markets for a number of important commodities.

For articles subject to frequent fluctuations in price, monthly averages were made up of quotations for one day in each week and for a portion of the period from daily quotations. For other articles, monthly, quarterly, or semiannual quotations were secured.

Considerable attention was devoted to obtaining descriptive details so that price comparisons were based on the same or comparable commodities. By 1931, BLS had developed a specification for each commodity in the index. These specifications defined quality as precisely as possible, including the principal price-determining characteristics, terms of sale, and other details. These specifications were refined and improved over the years.

The prices used in the index were usually net cash prices, f.o.b., for the article described by the specification. Delivered prices were included only when it was customary for an industry to quote on the delivered basis.

E 52–63. Wholesale price indexes (Warren and Pearson), by major product groups, 1749–1890.

Source: George F. Warren and Frank A. Pearson, *Prices*, John Wiley and Sons, New York, 1933, pp. 11–13, 25–27 (copyright).

The indexes are also presented in *Wholesale Prices for 213 Years, 1720–1932* (see general note, series E 23–122), *Memoir 142*, part 1, pp. 7–10 and 84–111. The "all-commodities" index for 1749–1889, converted to the base of 1926, is included in Bureau of Labor Statistics (BLS) Bulletin No. 572, *Wholesale Prices, 1981, 1933,* appendix, pp. 111–114.

The primary aim of Warren and Pearson was to present monthly comprehensive index numbers for the 19th century corresponding to those of BLS for 1890 and later years. The full series constitutes the longest index now available for 1720–1932. For 1890–1932, Warren and Pearson used the BLS indexes (series E 40–51) converted to the base 1910–14. Their work covered the period 1797–1890; the index was extended back to 1720 by Herman M. Stoker.

The bulk of the prices on which the index is based relate to New York City and were obtained from newspapers, supplemented with prices published in the *Report of the Secretary of the Treasury on the State of the Finances* (usually referred to as the *U. S. Finance Report)* for 1863. The number of products included in the all-items index numbers for 1797–1890 varied from a low of 113 in 1830 to 146 in 1880. For the extension back to 1720, Stoker encountered some serious gaps in the available source materials, especially for years prior to 1749. For 1720–1748, the price data were scarce and irregular, and an index could be computed only for certain months in each year. For 1749–1782, the number of commodities included generally varied from 11 to 19; and for 1783–1796, 71 series were available for most years.

The index numbers for 1797–1890 are weighted arithmetic averages of relatives, computed first on the 1876–91 base, then converted to the 1910–14 base using the relationship with BLS index numbers for 1890–1898. When one commodity was substituted for another, a linking procedure was employed. Two all-commodity indexes were prepared, one with fixed group weights throughout the whole period, and one with varying group weights. The latter is presented here as series E 52.

Separate subindexes (series E 53–63) were computed by Warren and Pearson for the 10 groups of commodities formerly used by BLS with a supplemental index for spirits. Within each group, weights representing the importance of the priced commodities in the total trade of the United States were varied over the years to represent, insofar as possible, changes in importance. (Specific mention should be made of the reduction in the importance of cotton during the Civil War period. Cotton was scarce and prices very high so weights were based on the amount available for consumption for 1861–1866 and on production for 1867–1871.) Censuses, imports, exports, and similar official figures were used as weighting factors. However, data were meager for the early years and some arbitrary weight assignments were necessary.

For 1787–1800, Stoker constructed a "71-commodity index" with the same commodity group classification and methods of calculation as those employed by Warren and Pearson. These all-commodity and group indexes were linked to the Warren-Pearson indexes. His "16-commodity index" for 1720–1787 based on the 11–19 items (practically all farm products and foods) was in turn linked to the 71-commodity index.

There are discrepancies between *Prices* and *Memoir 142* for farm products (series E 53) for 1807, 1808, and 1827. The figures shown in series E 53 are averages of monthly data in *Memoir 142*.

E 64–72. Wholesale price indexes (BLS), by durability of product, 1947–1970.

Source: U.S. Bureau of Labor Statistics, *Handbook of Labor Statistics, 1971,* Bulletin 1705, p. 285.

These indexes were constructed by recombining commodity segments of the regular BLS Wholesale Price Index according to durability. The basic weights, the price data, and the calculation methods were the same as for the regular indexes (see text for series E 23–39). The commodity groups included in each of these special indexes are listed in BLS Bulletins, *Wholesale Prices and Price Indexes,* annually for 1957–1963, and in *Wholesale Prices and Price Indexes* for January 1967 (final) and February 1967 (final).

Manufactured commodities were generally classified on the same basis as that used by the Federal Reserve Board for its Index of Industrial Production. The classification of the "raw or slightly processed goods" was based for the most part on that used by Frederick C. Mills in *Prices in Recession and Recovery,* National Bureau of Economic Research, New York, 1936, pp. 472474.

E 73–86. Wholesale price indexes **(BLS), for** economic sectors, by stage **of** processing, **1913–1970.**

Source: US. Bureau of Labor Statistics, 1913–1946, Bulletin 1235, *Wholesale Prices and Price Indexes,* 1957, p. 26 (these series on a 1926 base appear in the following publications: 1913–1941, *Handbook of Labor Statistics,* 1941 edition, p. 733; 1942–1946, Bulletin 947, *Wholesale Prices, 1947,* p. 6); 1947–1970, Bulletin 1705, *Handbook of Labor Statistics, 1971,* p. 286.

Although the basic weights, the price data, and the calculation methods for these indexes were the same as those used for the regular indexes, the series shown comprise two parts, one for 1903–1946 and the second for 1947–1970. Prior to the revision of the regular Wholesale Price Index (WPI) in 1952 (which was carried back to 1947), each commodity in the WPI was classified in one of three groups: Raw, semimanufactured, or manufactured. The prices were weighted using quantities as specified for series E 40–51. The list of commodities included in each classification is shown in BLS Bulletin 473, p. 62.

The more refined economic sector classification used for 1947–1970 required adjustments to these procedures. Many commodities were considered to fall appropriately in more than one category. For 1947–1966, the base weight for each such article was, therefore, distributed among the economic sectors on the basis of percentage distributions by end use, derived from the BLS interindustry studies for 1947. From 1967 to 1970, the 1958 interindustry study of the Commerce Department's Office of Business Economics was used as a guide. The same price series was used in several sectors when a commodity was classified in more than one sector. It was recognized that this procedure had some disadvantages, but it was believed to have little effect on the measurement of price trend.

In splicing the two parts, the index for "raw materials" was considered as most nearly comparable with the new "crude materials for further processing"; "semimanufactured" with "intermediate materials, supplies, and components"; and "manufactured" with "finished goods."

E **87–89.** Wholesale price indexes **(BLS), by 2** levels **of** processing, **for** identical commodities, **1890–1926.**

Source: **U.S.** Bureau of Labor Statistics, Bulletin No. 440, *Wholesale Prices, 1890 to 1926,* pp. 28–29, 1926.

These series were calculated for the first time in 1915, were extended back to 1890, and continued through 1926. The items in each of the indexes were selected from those included in the BLS regular wholesale price index (see series E 40). The indexes are fixed weight aggregative indexes, derived by weighting the price series with the estimated quantity of each article marketed in 1919. Similar figures for 1890–1914 on the 1914 base, using 1909 quantity weights may be found in BLS Bulletin No. 181, *Wholesale Prices, 1890–1914,* pp. 28–29.

E **90–122.** General note.

The inadequacy of the available statistics on commodity-price and wage movements over long periods of time led to the formation of the International Scientific Committee on Price History in 1929. In the United States, the attention of this Committee was directed to providing long series of prices for important commodities for pre-Civil War years. Price history research was initiated or expanded for 6 important markets — Philadelphia, Charleston, S.C., Cincinnati, New Orleans, New York City, and Boston. Information is presented here only for the first 4 of these markets.

The results of the investigations in all 6 areas were summarized in the form of wholesale price index numbers by the individual research directors and presented by Arthur H. Cole in *Wholesale Commodity Prices in the United States, 1700 to 1861,* Harvard University Press, Cambridge, 1938. **A** statistical supplement to Cole's report contains the actual monthly quotations for approximately 45 commodities for the years covered in each market.

The source materials for the price data included newspapers, merchants price lists, account books, and similar records that could be located. Differences in the availability of price and weighting data from area to area contributed to differences in the indexes derived, particularly with respect to the appropriate base periods, the length of the series, and the classifications of commodities for subindexes.

E 90–96. Wholesale price indexes (Taylor), for Charleston, **S.C., 1732–1861.**

Source: Arthur H. Cole, *Wholesale Commodity Prices in the United States, 1700–1861,* Harvard University Press, Cambridge, 1938, pp. 158, 155–157, and 159–167 (copyright).

See also articles by George Rogers Taylor, "Wholesale Commodity Prices at Charleston, S. C., 1732–1791," *Journal of Economic History,* February 1932, pp. 356–377, and "Wholesale Commodity Prices at Charleston, S.C., 1796–1861," August 1932 supplement to the *Journal,* pp. 848–868.

See also general note for series E 90–122.

Taylor's research in commodity prices was summarized in separate index numbers for 8 different periods. The choice of time periods was made partly to reflect business conditions in Charleston and partly to take account of availability of data. Newspapers and original manuscript materials produced price series for a maximum of 32 items for 1818–1842 and a minimum of 6 for 1732–1747. Gaps were relatively frequent and no quotations at all appeared for 1792–1795.

Indexes for each period were weighted arithmetic averages of price relatives, with weights representing the approximate importance of each commodity in South Carolina commerce. The weights were unchanged for all years within each time period but were changed from period to period. An all-commodities series was made up of prices for 6 articles for 1732–1747, 10 articles for 1748–1761, and 16 articles for 1762–1775. In each period, rice represented 50 to 64 percent of the total weight. For the 5 later time intervals, weighted sub-indexes were combined with group weights based on the following total number of price series: 1780–1791, 20; 1796–1812, 18; 1813–1822, 13; 1818–1842, 32; 1843–1861, 20. During these years, the importance of rice declined from about 37 percent of the total weight to 5 to 7 percent, while the importance of cotton increased from zero in 1791 to almost 36 percent in 1843–1861.

The all-commodity series (E 90) was obtained by splicing the indexes for the separate periods.

E **97–110.** Wholesale price indexes (Bezanson), for Philadelphia, unweighted geometric average, **1784–1861.**

Source: Anne Bezanson, Robert D. Gray, and Miriam Hussey, *Wholesale Prices in Philadelphia, 1784–1861,* part I, Industrial Research Study No. 29, Philadelphia, 1936, p. 392. (Copyright, University of Pennsylvania; reprinted by permission.)

See also general note for series E 90–122.

Records of prices for Philadelphia provided continuous price reports for 186 series covering 140 different commodities for 1784–1861 and 205 series for 157 commodities for 1819–1861. Monthly relative prices for the individual commodities and changes in the description of the commodities quoted are included in part II of the source, published as Industrial Research Study No. 30. Bezanson and her associates have also computed indexes for 1852–1896, corresponding to those for the earlier part of the century, which are available in a Bureau of Labor Statistics (BLS) pamphlet, *Wholesale Price Indexes for Philadelphia, 1852–96: Annual Group Totals.*

Indexes for all commodities and for subindexes using different modes of classification were computed as unweighted geometric averages of price relatives. Two all-commodities indexes were prepared, one based on 140 commodities (series E 97) and one for a more limited period for 157 commodities.

In addition to the subindexes selected for inclusion here, other subindexes for commodity groupings generally comparable to those of the BLS were also calculated. All indexes are available on a monthly basis.

E 111. Wholesale price indexes (Bezanson), **for** Philadelphia, unweighted arithmetic average, **1720-1861.**

Source: See source for series E 97–110.

For the colonial period, Bezanson and her associates obtained some price data for 82 series. Because of the gaps in the data, however, indexes for the early years were based on prices for many fewer commodities.

Indexes for 1720–1861 were computed as unweighted arithmetic averages of relatives of prices for the same 12 commodities for the full period. The source also includes an unweighted geometric index of 20 commodities for 1731–1861.

E 112-114. Wholesale price indexes (Berry), for Cincinnati, **1816–1861.**

Source: Series E **112,** 1816–1860, Arthur H. Cole, *Wholesale Commodity Prices in the United States, 1700–1861,* Harvard University Press, Cambridge, 1938, p. 185 (averages of the monthly data were computed from the source); 1861, estimated by Ethel Hoover from series E 113 and E 114 with weights shown in Cole (cited above), p. 81. Series E **113-114,** Thomas S. Berry, *Western Prices Before 1861,* Harvard University Press, Cambridge, 1943, p. 564. (Copyright.)

See also general note for series E 90–122.

These indexes were weighted arithmetic averages of price relatives, computed for 3 separate time periods which were spliced to obtain the continuous series. For 1816–1825, prices for 21 commodities were assembled, **13** "identified with northern agriculture" and 8 "not identified with northern agriculture." For 1824–1846, the total was 37 with 20 in the first category and **17** in the second. For 1846–1861, the total was 50, with 29 for northern agriculture, and 21 for other. The weighting factors for the first period were estimated from New Orleans receipts in 1825, while those for the 2 later periods were based on receipts at Cincinnati for 1845–1848 and 1852–1856. Berry's analysis is accompanied by many tabulations of supplementary data, including actual prices for individual articles.

E 115-117. Wholesale price indexes (Berry), for Ohio River Valley, **1788-1817.**

Source: Thomas S. Berry, *Western Prices Before 1861,* Harvard University Press, Cambridge, 1943, pp. 563–564 (copyright).

See also general note for E 90–122.

In his study of Cincinnati prices, Berry encountered considerable difficulty in obtaining price information for years before 1816. He enlarged his geographical coverage for the market to include Lexington and Louisville, Ky., and Pittsburgh, Pa., and was successful in constructing 14 commodity price series for 1788–1816 from data in "account books of backwoods merchants" and from local journals.

The indexes were computed as unweighted averages of price relatives. The annual prices used to obtain the relatives were medians of all Ohio Valley quotations for each item each year.

E **118-122.** Wholesale price indexes (Taylor), **for** New Orleans, **1800–1861.**

Source: Arthur H. Cole, *Wholesale Commodity Prices in the United States, 1700–1861,* Harvard University Press, Cambridge, 1938, pp. 170–179 (copyright),

See also general note for series E 90–122.

A considerable difference was found in the volume of information available for New Orleans from decade to decade. Therefore, New Oreleans indexes were prepared for 4 separate time periods. Data for 8 commodities, primarily agricultural, were combined into an index for "Louisiana" products for 1800–1812 (July). For a part of this period, 1804–1812 (April), 2 series were constructed, 1 for 29 domestic products and the other for 15 imported goods. For 2 later periods, the volume of data was sufficient to set up 3 subindexes, classifying the commodities by origin. The number of articles included was: For 1815–1842, 5 Louisiana products, 34 other domestic products, and 11 foreign imports; for 1840–1861, the corresponding numbers of articles were 4, 37, and 8.

All of the index numbers were calculated using the method of weighted averages of relatives. The weights in the several time periods represented the importance of the various commodities in the trade of New Orleans.

The all-commodities index (series E 118) was obtained by splicing the "all-commodities" indexes for the different periods.

E 123-134. General note.

The wholesale prices for selected commodities from 1800 through 1970 provide an indication of price levels (in current dollars) for selected basic commodities at a particular point in time. Due to the changes in descriptions (specifications) for the commodities, in markets from which prices were obtained, in quality of the product which takes place over time, and other factors which affect prices, these series provide only a general indication of price trends.

From among the several hundred commodities for which wholesale prices have been published in various reports, 12 were selected for publication in the form of actual prices. Generally, consideration was given to representation of commodities in different product groups, importance in U.S. trade, and the length of the series available.

The descriptions for each commodity insofar as they could be determined and the sources from which the prices were compiled are shown below in the detailed notes for each series. When annual averages were not available in the original source, they were computed for this publication. If 12 monthly figures were presented, a simple average was calculated, but if only quarterly figures were given, straight line interpolation was used to estimate missing months.

It was not possible to obtain one continuously comparable series for the full period. The data were assembled from several sources for each commodity and there were, frequently, changes in the basis of quotation even in the same source. Two prices are shown for years in which a change in the series occurred, if it was possible to obtain the information. In some series, mostly prior to 1890, changes in the basis of quotation occurred and no overlapping prices were available. Such changes are noted below in the text for each series.

Prices for earlier years for some commodities are available in the same sources as those indicated for 1800, and in other publications. Because of limitations of time and space, however, figures prior to 1800 were not included in this chapter. For example, prices of wheat back to 1700 may be found in the publication by Cole, cited as the source for wheat prices for 1800–1825. Wheat prices in the New England colonies at 10-year intervals for 1630–1750 are included with prices for several other commodities in Bureau of Labor Statistics Bulletin 604, *History of Wages in the United States From Colonial Times to 1928,* p. 19.

The *Annual Report of the Director of the Mint,* cited as the source for practically all series for some part of the period 1825–1880, was used despite the lack of commodity descriptions. The prices included in this report were summaries of the New York prices included in the *U.S. Finance Reports* of 1863, 1873, and 1874 which had been compiled from the newspaper, *The New York Shipping and Commercial List.* Prices for 1875–1880 were also compiled from this source. Such descriptions as appear in the notes for each series of prices taken from *U.S. Finance Reports* were obtained from the report for 1863.

An alternate source for many of the price series included in the *Aldrich Reports* (cited for data prior to 1890) is *Monthly Summary of Commerce and Finance in the United States,* 57th Congress, 2d Session, House Doc. No. 15, part 1, 1902, pp. 59–100. The *Summary* covers not only the years included in the *Aldrich Report,* but also extends the data through July 1902.

E 123. Wheat, 1800–1970.

Source: A.—1800–1825, Arthur H. Cole, *Wholesale Commodity Prices in the United States, 1700–1861,* Statistical Supplement, Harvard University Press, Cambridge, 1938 (copyright); B.—1825–1880, *Annual Report of the Director of the Mint to the Secretary of the Treasury for the Fiscal Year Ended June 30, 1881,* p. 50; C.—1880–1890, *Wholesale Prices, Wages, and Transportation,* Senate Report No. 1394, 52d Congress, 2d Session, part 2, 1893, p. 61 (one of the reports usually referred to as the *Aldrich Reports*); D.—1890–1970, compiled from Bureau of Labor Statistics reports and records. In general, annual average prices, when available, were taken from annual reports, *Wholesale Prices and Price Inderes,* through the year 1963. Thereafter, annual average prices were computed from monthly prices as published in monthly reports, *Wholesale Prices and Price Indexes.*

For 1800–1825, prices are for Philadelphia (commodity description not available). For 1825–1880, prices are for New York, "Northern" wheat; the *1863 U.S. Finance Report* (from which these prices were partially compiled) shows prices for "genesee" for most years, 1825–1863, but for a few years prices refer to "North River," "prime white," "western," "western red," or "mixed and red." For 1880–1890, prices are for "wheat No. 2, Winter, Chicago." For 1890–1913, prices are for Chicago "Range No. 1 Northern Spring and Nc. 2 Red Winter" in carlots. For 1913–1948, prices are for Kansas City, "No. 2, hard (ordinary)" in carlots. For 1949–1961, prices are for Kansas City, "No. 2, hard winter, closing spot market price, carlots, f.o.b. track." From 1962 to 1970, prices are for Kansas City, "No. 1, hard winter."

See also general note for series E 123–134.

E 124. Wheat **flour,** 1800–1970.

Source: See sources cited for series E 123; 1800–1825, source A; 1825–1870, source B; 1870–1890, source C, p. 79; 1890–1970, source D.

For 1800–1825, prices are for Philadelphia, "Superfine" flour, per barrel of 196 pounds. For 1825–1870, prices are for New York, "Superfine" flour, per barrel. For 1870–1890, prices were provided by a New York firm (commodity description not available). For 1890–1913, prices are for "winter straights, f.o.b., New York," per barrel. For 1913–1943, prices are for "Straights, hard winter, white, in carlots, f.o.b., Kansas City," per barrel. During 1943, the basis of quotation was changed from per barrel to flour in sacks, per 100 pounds. For 1950–1970, prices are for "hard winter, bakery, short patents, plain or enriched, in 100-pound sacks, carlots, f.o.b. mill, Kansas City," per 100 pounds. During 1918 and a part of 1946, prices were quoted on the standard provided under government regulation.

See also general note for series E 123–134.

E 125. Sugar, 1800–1970.

Source: See sources for series E 123; 1800–1825, source A; 1825–1860, source B; 1860–1890, source C, p. 114; 1890–1970, source D.

For 1800–1825, prices are for the Philadelphia market. Prices for 1800 refer to "Muscovado, brown"; 1801–1802 (Oct.), "Muscovado"; 1802 (Nov.)–1813 (Oct.), "Muscovado, first quality"; 1813 (Nov.)–1815 (Apr.), "Muscovado, unspecified"; 1815 (May)–1825, "Muscovado, prime." For 1825–1860, prices are for New York, "Cuba" sugar; the *1863 U.S. Finance Report* (from which the data were compiled) quoted "Muscovado" for 1825–1829 and 1845–1860, "Cuba Muscovado" for 1830–1836 and "Cuba" for 1837–1844. For 1860–1890, prices are for "Refined, granulated" sugar (no market specified). For 1890–1946, prices are for New York, "Granulated" sugar. Prices were quoted for sugar in barrels until 1955 when the basis of quotation was changed to 100-pound paper bags. For 1947–1970, the description was amplified to "granulated, domestic, cane, refined, New York," per pound. Prices for 1934–1970 include the excise tax of 53½ cents per 100 pounds, effective in May 1934.

See also general note for series E 123–134.

E 126. Cotton, raw, 1800–1970.

Source: 1800–1890, Mathew B. Hammond, *The Cotton Industry, an Essay in American Economic History,* American Economic Association, New Series No. 1, Macmillan, New York, 1897, p. 358; 1890–1970, see source D for series E 123.

For 1800–1890, prices refer to "Middling uplands" cotton for the New York market and are available back to 1790. For 1800–1820, prices are estimates made by merchants or government officials. For 1821–1890, prices were taken from James L. Watkin, *Production and Price of Cotton for One Hundred Years,* published by the Department of Agriculture, 1895. For 1890–1941, prices are for New York, "Upland, Middling" cotton, spot. In 1936, "7/8 inch" was added to the description. For 1941–1954 (July), prices are for "Middling, 15/16 inch," 10 spot market average. For 1954 (July)–1956 (Aug.), the number of markets included in the average was increased from 10 to 14. The July 1954 average for 10 markets was $0.342 per pound and for 14 markets, $0.341 per pound. For 1956 (Aug.)–1957, prices are for "Middling, 1-inch," 14 spot market average. In Aug. 1956, the average for 15/16-inch staple was $0.348 per pound and for 1-inch staple $0.357 per pound. Beginning Sept. 1962, prices are for 15-market average. Beginning July 1968, prices are for "1 1/16 middling," 12 spot market average.

See also general note for series E 123–134.

E 127. Wool, 1813–1970.

Source: See sources cited for series E 123; 1813–1825, source A; 1825–1850, source B, p. 60; 1850–1890, source C, p. 387; 1890–1970, source D.

For 1813–1825, prices are for Philadelphia, "Merino clean" wool except for 1819 and 1820 when description was "Merino" wool. For 1825–1850, prices are for New York, "Merino" wool. For 1850–1890, prices are for Boston, "Ohio, fine fleece, scoured." For 1890–1913, prices are for, "Domestic, Ohio, fine fleece (x and xx grades), scoured"; for 1913–1945, for Boston, "Domestic, Territory, staple, fine and fine medium, scoured"; for 1946–1949 for Boston, "Domestic, Territory, staple, fine combing, graded, scoured." For 1950–1970, the description was changed with no difference in price level to "Domestic, fine, good French combing and staple, clean basis."

See also general note for series E 123–134.

E 128. Cotton sheeting, 1800–1969.

Source: See sources cited for series E 123; 1800–1847, source A; 1847–1890, source C, p. 155; 1890–1969, source D.

Prices are for Philadelphia, "Russian, unspecified" for 1800–1804, "Russian, brown" for 1805–1814 and 1824–1847, and "Russian, half bleached" for 1815–1823. Prices were shown "per piece" (approximately 100 yards). For 1847–1890, prices are for "sheeting, brown, 4-4, Atlantic A," per yard (no market specified). For 1890–1912, prices are for "brown, Indian head, 4-4, 2.85 yards to pound, factory." For 1913–1941, description same except that the width designation was changed in 1913 to "36-inch" instead of "4-4," and "48×48, carded yarn" was added in 1923. For 1941–1943 (May), prices are for "Unbleached, 36-inch, 48×48, 2.85 yards per pound, Class A, non-feeler, f.o.b. mill." For 1943 (May)–1947, description same except for change from "48×48" to "48×44." For 1948–1969, prices are for "Unbleached (series 1), 40-inch, 48×48, 2.85 yards per pound, Class A, nonfeeler, f.o.b. mill." The January 1948 price for the former description (36-inch, 48×44) was $0.279 and for the new description (40-inch, 48x48) was $0.289 per pound.

See also general notes for series E 123–134.

E 129. **Coal,** anthracite, 1800–1970.

Source: See sources cited for series E 123; 1800–1825, source A; 1825–1833, source B; 1890–1970, source D. For 1833–1890, Amer-

ican Iron and Steel Association, *Statistics of the American and Foreign Iron Trades for 1896,* Philadelphia, 1897, p. 91.

Prices are for Philadelphia, "Virginia" coal for 1800–1811 and 1814–1825, and "Domestic" for 1812 and 1813. There was no description for 1826–1833. For 1825–1833, prices are for New York, "anthracite coal (Schuylkill)." For 1833–1890, prices are for "Schuylkill white ash lump" coal, by the cargo, at Philadelphia, per gross ton. For 1890–1970, prices are for "Pennsylvania anthracite, chestnut," but the basis of quotation was changed several times. For 1890–1928, the basis was "New York Tidewater," per gross ton; for 1928–1931, "destination on tracks," per gross ton; for 1931–1947, per net ton (2000 pounds); and 1947–1970, "f.o.b. cars" per net ton.

See also general note for.series E 123–134.

E 130. Steel rails, **1847-1970.**

Source: 1847–1890, American Metal Market and Daily Iron and Steel Report, *Metal Statistics,* 1921, p. 91. (Reprinted with permission of American Metal Market, Fairchild Publications, Inc., N.Y., N.Y., copyright.) For 1891–1970, see source D for series E 123.

For 1847–1867, prices are for "Iron rails, Eastern Pennsylvania mill" (production of steel rails did not exceed production of iron rails until 1877). The source also shows prices of iron rails of this description for 1868–1882. For 1867–1870, prices are for New York "Steel rails, Bessemer," per gross ton. For 1871–1890, prices are for "Steel rails, Pennsylvania mill." For 1891–1913, prices are for "Bessemer, Standard, f.o.b. mill, Pittsburgh," per long ton; for 1913–1946, for "Open hearth, standard, f.o.b. mill"; for 1947–1953 (April), for "Standard, heavier than 60 pounds, No. 1 open hearth, f.o.b. mill" (refinement of previous specification and quoted per 100 pounds — no break in series); thereafter, for "Standard, carbon steel, No. 1 open hearth, 115 pounds per linear yard, control cooled, base quantity, f.o.b. mill."

See also general note for series E 123–134.

E 131. Nails, **1800-1969.**

Source: See sources cited for series E 123; 1800–1828, source A; 1828–1834, source B, p. 54; 1890–1969, source D. For 1835–1890, see source for series E 129, 1833–1890, p. 87. (For 1835–1849, prices were compiled from the *Report of the Secretary of the Treasury,* 1849; for 1850–1859, by the American Iron and Steel Association from the books of the Duncannon Iron Company; and for 1860–1890, by an official of the Duncannon Iron Company.)

For 1800–1828, prices are for the Philadelphia market. For 1814–1827, prices are for "Cut nails, all sizes"; for other years, "assorted sizes." For 1828–1834, prices are for New York, "Nails, cut." For 1835–1890, prices are for "Cut nails." For 1890–1953, prices refer to "wire, 8 penny, fence and common, 100-pound keg, f.o.b. Pittsburgh." "Base price" was added to the description in 1926 and fence nails were not included after 1947. For 1953–1959, prices refer to "wire, carbon steel 8d, common, carload lots, f.o.b. mill." The April 1953 price for the former specification was $7.41, and for the new specification, $7.33 per 100 pounds. "Packed in fiberboard boxes" was added to the description for 1955. "Carload lots" was changed to "in lots of 30,000 lb. or over" in Oct. 1960. Change was not considered to affect comparability of prices before or after.

See also general note for series E 123–134.

E 132. Copper, **1800-1969.**

Source: See sources cited for series E 123; 1800–1825, source A; 1825–1860, source B, p. 52; 1890–1970, source D. For 1860–1889, see source for series E 130, 1847–1890, p. 299.

For 1800–1825, prices are for the Philadelphia market. Prices are for "Copper in sheets," 1800–1801 (Apr.) and 1805 (June)–1809 (June); "Sheathing unspecified," 1801 (May)–1802 (Dec.), 1809 (July)–1818 (Apr.), and 1824 (Sept.)–1825; "Sheathing, cold rolled," 1803–1805 (May); and "Sheathing unspecified," 1818 (May)–1824 (Aug.). For 1825–1860, prices are for New York, "Sheathing." For 1860–1889, prices are for New York, "Lake Copper." The price shown for 1890 is the same as that in *Metal Statistics,* 1921. For 1890–1907, prices are for New York, "Lake Copper"; for 1907–1927, for "Copper ingot, electrolytic, early delivery, refinery in New York"; for 1927–1953, for "Copper, electrolytic, delivered, Connecticut Valley"; and for 1954–1969, for "Copper ingot, electrolytic.

See also general note for series E 123–134.

E 133. Turpentine, **1800-1969.**

Source: See sources cited for series E 123; 1800–1825, source A; 1825–1840, source B, p. 56; 1840–1890, source C, p. 240; 1890–1969, source D.

For 1800–1825, prices are for the Philadelphia market, per barrel (31½ gallons per barrel). No description was available, but a comparison of prices indicates that they may be for "soft" turpentine. For 1825–1840, prices are for the New York market (no description is available). For 1840–1890, prices are for New York, "Spirits of turpentine." For 1890–1942, prices are for "Southern, barrels, at New York." The description was amplified in 1936 by the addition of "carlots, ex dock, gum spirits." For 1942–1951, prices refer to "Gum spirits, bulk, f.o.b. Savannah, Ga." For 1952–1956 (Oct.), quotations are for "Spirits of turpentine, tank cars, at New York." The Jan. 1952 price for the former specification (Savannah) was $0.80 per gallon and for the new (New York), $0.76 per gallon. For 195.6 (Nov.)–1958 (Jan.) prices are for "gum, tank cars" at New York. For 1959 (Mar.)–1969 prices are for carlots or truckload quantities f.o.b. car or trucks at processing plants in Georgia and Florida. "Midpoint of range for week" was added in 1961.

See also general note for series E 123–134.

E 134. Brick, **1849-1969.**

Source: See sources cited for series E 123; 1849–1890, source C, p. 222; 1890–1969, source D.

For 1849–1890, prices are for "common domestic building" (market not indicated). For 1890–1933, prices are for "Common, Red, Domestic, at New York"; 1933–1947, for "Common building, f.o.b. plant" (composite of approximately 50 firms); for 1947–1961, for "Building brick, f.o.b. plant or New York dock" (composite of approximately 25 firms); and for 1962–1969, for "Building brick, f.o.b. plant." Changes in list of firms from time to time did not result in any significant differences in the annual average prices.

See also general note for series E 123–134.

E 135-186. General note.

An appropriate name for indexes of retail price changes has been the subject of considerable discussion. Most indexes that have at some time been called "cost-of-living" indexes measure changes in retail prices for the goods and services families buy. Insofar as possible, the retail prices are for the same list of items in the same localities, the same qualities, and the same quantities from one period to the next. The indexes, therefore, measure changes in costs for living in the same way and in the same place.

Generally, people tend to think of the amount of money they spend for commodities and services as their cost of living. Changes in total expenditures reflect changes in costs resulting from differences in the place or manner of living, such as shifts in the kinds of goods and services bought, and may represent a better or a worse standard than at some earlier date.

The term "Consumer Price Index" was adopted by the Bureau of Labor Statistics (BLS) and the National Industrial Conference Board after much controversy during World War II regarding the BLS *Cost of Living Index.* For a discussion of differences in concept and measurement of the cost of living, see the *Report of the President's Committee on Cost of Living,* Office of Economic Stabilization, 1945.

E 135–166. Consumer price indexes (BLS)—all items, 1800 to 1970, and by groups, 1913–1970.

Source: U.S. Bureau of Labor Statistics (BLS), 1800–1912, series E 135 only, *Handbook of Labor Statistics 1973*, Bulletin 1790; 1913–1970, *Consumer Price Indexes for Urban Wage Earners and Clerical Workers; U.S. City Averages* (1967=100), Historical Series A through I.

See also general note for series E 135–166.

The BLS Consumer Price Index measures changes in retail prices of the goods and services bought by city wage earners and clerical workers. The indexes from 1800 through 1912 are estimates, based on price data from sources other than BLS. It was originated on a comprehensive basis at the end of World War I when data were in demand for wage negotiations in shipbuilding cities. A Department of Labor study of the cost of living in 92 shipbuilding and other industrial centers was made in 1918–19, as reported in BLS Bulletin 357, *Cost of Living in the United States*. The first publication of changes in the "cost of living" was in the BLS *Monthly Labor Review* for October 1919 and regular publication has continued since February 1921. The frequency of publication was increased from semiannually to quarterly in 1935. Since September 1940, the index has been computed and published monthly. The index is published each month in a press release, a detailed report, and in the *Monthly Labor Review*. The indexes shown here are annual averages.

All retail price data are collected with the use of specifications to ensure comparisons from period to period of prices for the same or similar qualities insofar as possible. These specifications include the quality factors associated with price differences and other physical characteristics needed for identification from store to store and from one pricing period to the next. A discussion of the use of specifications is contained in BLS Bulletin 1182, *Average Retail Prices: Collection and Calculation Techniques and Problems*. Every effort is made to obtain the prices paid by the customer, not list prices from which discounts normally are given. Sales, excise, and other taxes related to the purchase or continued ownership of consumer goods and services are reflected wherever applicable.

A number of changes in coverage, method, classification, and base periods have been made since these indexes were first issued in 1919 with index numbers back to 1913. Until 1935, the "cost-of-living" indexes were calculated using quantity weights derived from the BLS family expenditure study in 1917–19. The weights related to the individual items priced and to geographic areas rather than to individual cities. Group indexes were combined with percentages representing the importance of the group in total expenditures. The goods and services included were described in general terms only. The measurement of price change for comparable articles was accomplished by careful attention on the part of the field representative in obtaining price quotations for the same quality from one period to the next from the same respondents.

A major improvement in the index calculation method was introduced in 1935 and is described in Faith M. Williams, Margaret H. Hogg, and Ewan Clague, "Revision of Index of Cost of Goods Purchased by Wage Earners and Lower-Salaried Workers," *Monthly Labor Review*, September 1936, pp. 819–837. In the 1935 revision, consumption weights for individual cities were derived from the 1917–19 expenditure study, and population weights (average population in 1920 and 1930) were used to combine city data. At this time, indexes back to 1913 were recalculated based on the prices collected for the former indexes. "Specification pricing" was also introduced in 1935; see John H. Cover, *Retail Price Behavior*, University of Chicago Press, 1935.

Another revision was completed in 1940 to take into account the results of a study of family expenditures in 1934–36. At this time, indexes back to 1935 were recalculated with weights derived from this study. Indexes for earlier years were not recalculated completely, but the former group indexes were recombined with revised weights. Other improvements introduced are described in the *Bureau of Labor Statistics' New Index of Cost of Living*, Serial No. R. 1156, reprinted from the August 1940 issue of the *Monthly Labor Review*.

Table II. Number of Cities Included in BLS Consumer Price Index (CPI) for All Items (E 135) and for Foods (E 136–137), and Weights Used: 1913 to 1970

Period	Number of cities		Weights used	
				Group weights in—
1913–1917	19	40-45	1917–19	none
1918–1924	32	46-51	1917–19	1920 and 1930
1925–1930	32	51	1917–19	1920 and 1930
			[1] 1934–36	
1930–1934	33	51	[1] 1934–36	1930
1935–1942	33-34	56-64	1934–36	1930
1943–1949	34	56	1934–36	May 1942
1950–1952	34	56	[2] 1947–49	1950
1953–1963	46	46	[3] 1950	1950
1964–1965	50	50	[4] 1960–61	1960
1966–1970	56	56	[5] 1960–61	1960

[1] Individual item weights for 1918–1935 were derived from the 1917–19 study. Group weights as shown.
[2] Family expenditures in 7 cities. [3] Adjusted to 1952 for price change.
[4] Adjusted to 1963 for price change. [5] Adjusted to 1965 for price change.

During World War II, shortages and rationing imposed many measurement problems. The adjustments made by BLS in weights and in pricing are described in Faith M. Williams, "Bureau of Labor Statistics Cost of Living Index in Wartime," *Monthly Labor Review*, July 1943.

Before the comprehensive revision in 1953, when numerous changes in index procedures and coverage were introduced, an "interim adjustment" was made in 1951. This adjustment included a correction for "new unit bias" in the rent index (resulting from wartime rent controls) for 1940–1950 and the introduction of revised commodity weights based on expenditure surveys in 7 cities during 1947–1949. The revised commodity weights were used to recalculate indexes back to 1950 but not earlier years. A description of the adjustment is in BLS Bulletin 1039, *Interim Adjustment of Consumer Price Index*. The "interim adjustment" resulted in the publication of two index series for 1940–1952—the "old series" and the "adjusted series." When the comprehensive revision was completed in 1953, the revised indexes were linked to the "adjusted series."

In the 1953 revision, the city sample was changed to include small and medium-sized cities and the expenditure concept was broadened to include the purchase price of a house. (See February and April 1956 issues of *Monthly Labor Review* for a discussion of housing costs in the CPI.) Pricing of restaurant meals and home repair and maintenance items was begun and several other items were added. Items were regrouped into 8 major groups.

A later revision of the CPI was completed in 1963 and incorporated into the historical index series in 1964. The revised index is based on prices of about 400 goods and services; the goods and services priced for the index were chosen to represent price trends for all goods and services bought by families of urban wage earners and clerical workers. The selection was made on the basis of a detailed study of expenditures of 4,912 urban wage earner and clerical worker families and 585 single workers in 1960–61. The probability an item had of being selected for pricing in the index was proportional to its importance in index-family consumption expenditures in the 1960–61 base period. The average size of the families covered by the index was estimated to be about 3.7 persons and their average family income after taxes was estimated at about $6,250 in 1960–61.

In 1966, the CPI program was extended to six additional large areas as a result of a decision that indexes would be published for all standard metropolitan statistical areas (SMSA's) having a population of 1 million or more in 1960. Currently (1973), the sample of 56 areas on which the national index is based was chosen to represent all urban places that have population of 2,500 or more in 1960, including Alaska and Hawaii. Prices for foods and fuels and some other

goods and services are obtained monthly in all cities. Prices for most other goods and services are obtained monthly in the 5 largest areas and every three months in the remaining 51 SMSA's or small urban places. Rents are surveyed bimonthly in the 5 largest areas and every 3 months in other areas. Separate indexes are computed for 23 large areas. A comprehensive discussion of these and other improvements is contained in BLS Bulletin 1517, *The Consumer Price Index: History and Techniques.*

Food prices are obtained from about 1,800 food stores, including all important types of food retailers in each city. Rent figures are collected from tenants for approximately 40,000 rental units selected from block listings of the total rental housing market in each city. Prices for other goods and services are obtained from about 16,000 retail and service establishments patronized by wage earner and clerical families and including department stores, specialty shops, etc., with a minimum of 4 quotations per item per SMSA or urban place in most cases. Retail stores and service establishments are stratified by type of outlet and by area of the SMSA, i.e., central business district, neighborhood, and suburban pricing areas.

Price collection for the majority of goods and services is made by personal visit of BLS field representatives. Food prices are collected by local agents; for some items mail or telephone collection is supplemented by occasional personal visits.

The indexes are calculated using a variation of the base quantity weighted index formula. In practice, the aggregates are obtained by applying price relatives to "value weights" representing the cost of 1960–61 quantities as determined from the 1960–61 Consumer Expenditure Survey. The base period importance of an item selected with certainty for pricing in the index represents the annual average expenditure made for the item by the index population in the 1960–61 period. The base period importance of other items represents the expenditure made for that item and in addition a "pro rata" share of the weight of items not selected for pricing. Indexes for individual areas are computed using the expenditure weights for each area. National indexes are calculated by combining area data with weights representing 1960 population.

The standard reference base of the Consumer Price Index presented here is 1967 = 100. The index was changed to this base from its previous base of 1957–59 = 100 effective with release of the index for January 1971. The official standard reference base of the CPI was 1957–59 = 100 from 1962 through 1970, 1947–49 = 100 from 1953 through 1961, 1935–39 = 100 from 1940 through 1982, 1923–25 = 100 from 1935 through 1939, and 1913 = 100 from 1913 through 1934.

For a more complete description of the Consumer Price Index, see *Handbook oj Methods for Surveys and Studies,* BLS Bulletin 1458, Chapter 10, or BLS Bulletin 1517 cited above.

Source: U.S. Bureau of Labor Statistics, *1971 Handbook of Labor Statistics,* p. 255.

These indexes are based on a reclassification of the items priced for the Consumer Price Indexes (series E 135–166). The basic weights, price data, and calculation methods were the same as those used for the regular CPI. For a more complete description of the index, see BLS Bulletin **1517** cited above (E 135–166).

See also general note for series E 135–186.

The basic price data for these series are from Joseph D. Weeks, "The Average Retail Prices of Necessaries of Life," *Report on Statistics oj Wages in Manufacturing Industries,* Tenth Census, vol. 20, 1886. Averages of retail prices for 58 commodities were calculated by making simple averages of the prices reported for each item by one or two storekeepers in approximately 40 cities. The consistency of price movement and price level between prices identified as of "June 1" and those as "year" averages led to the inclusion of all prices to calculate an all-city average for each year. In calculating the relative prices for each commodity, a comparability procedure was used; that is, for each year two average prices were calculated—one comparable with the preceding year and the other comparable with the following year. Data for these 58 commodities were supplemented with estimates of price change for services (shoe repairs and medical care) as well as some additional items important in family spending estimated from other sources. The number of price series included in each of the index groups was food, 40; clothing, 12; rents, 2; fuel and light, 5; and other, 7.

Relative prices for the individual commodities were combined with value weights derived from the study of family expenditures in Massachusetts in 1875, supplemented by detailed expenditures of 232 families as given in the *Aldrich Reports (Wholesale Prices,* part *1,* pp. 62–63). The formula for calculation of the index was the algebraic equivalent of the Laspeyre index.

E 183. Cost-of-living indexes (Federal Reserve Bank of **N.Y.), 1820–1913.**

Source: Federal Reserve Bank of New York, *Index of Estimated Cost of Living in the United States* (1938 revision, mimeographed).

Indexes for 1820–1952 converted to the 1947–49 base and figures showing purchasing power of the dollar "in terms of retail prices" for the same period are available in a mimeographed release with same title dated March 17, 1953.

See also general note for series E 135–186.

This index was obtained by splicing together parts of indexes already available to approximate a continuous series. No adjustments were made to the original series other than those necessary to convert to a common base period. Indexes for 1820–1839 were taken from Alvin H. Hansen's cost-of-living indexes which were based on wholesale prices for these years. For 1840–1859, the indexes used were also obtained from Hansen's index which had in turn utilized the weighted index of wholesale prices (assuming all unpriced items moved with all priced items) computed by Roland P. Falkner for the Senate Committee on Finance. The Falkner indexes for 1840–1891 may be found in Senate Report No. 1394 *(Aldrich Report), Wholesale Prices, Wages, and Transportation, U. S.* Senate Committee on Finance, 1893, p. 93. For 1860–1879, the Federal Reserve Bank used the relative cost-of-living series prepared by Wesley C. Mitchell, who calculated his index from retail price data for 60 of the "necessaries of life" included in the *Weeks Report.* The original series may be found in Mitchell's *Gold, Prices, and Wages Under the Greenback Standard,* University of California Publications in Economics, vol. 1, Berkeley, March 1908, p. 91. For 1880–1889, the indexes were those of W. Randolph Burgess in *Trends of School Costs* (see series E 184). For 1890–1909, Paul Douglas' "Most Probable Index of the Total Cost of Living for Workingmen" (see series E 185) as published in *American Economic Review,* March 1926 supplement, p. 22, was used. Indexes for 1920–1912 were derived from the cost-of-living index for Massachusetts appearing in the Department of Labor and Industries of the Commonwealth of Massachusetts, *Report of the Commission on the Necessaries of Life,* February 1920, p. 118.

E 184. Cost-of-living index (Burgess), **1841–1920.**

Source: *The Review of Economics and Statistics,* February 1934, vol. XVI, No. 2, **p.** 26 (copyright, Harvard College, Cambridge).

For original data in dollars, see W. Randolph Burgess, *Trends of School Costs,* Russell Sage Foundation, New York City, 1920, p. 54.

See also general note for series E 135–186.

To determine changes in the purchasing power of teacher's salaries for his study of *Trends in School Costs,* Burgess compiled the series,

"Cost of Living Per Week for a Small Family Using the Same Amount of the Same Commodities Over the Entire Period." This series is based on prices for 10 foods important in wage earners' spending. Quantity weights, derived from BLS 1901–1902 consumer expenditure studies, were used to combine prices of the 10 foods. On the assumption that other less important items fluctuated with food prices, the total food cost was adjusted upward to approximate the total weekly cost for all items for a typical wage earners' family of man, wife, and two children. The factor used for adjustment was based on the ratio of food costs to total costs in 1901. The source of the price data is indicated by general reference to BLS, the Massachusetts Bureau of Statistics of Labor, the *Aldrich Reports*, records of purchases by the Army and Navy, and miscellaneous publications.

E 185. Cost-of-living index (Douglas), 1890–1926.

Source: Paul H. Douglas, *Real Wages in the United States, 1890–1926*, Houghton Mifflin Company, Boston and New York, 1930, p. 60 (copyright).

See also general note for series E 135–186.

This index was called the "Most Probable Index of the Movement of the Total Cost of Living for Workingmen" by Douglas, who constructed the series for his study of real wages during this period. The all-item indexes are available for two base periods, 1890–1899 and 1914.

For 1890–1914, the sources of the price data were BLS wholesale and retail reports. The available retail prices for foods were supplemented with wholesale prices for additional foods. These wholesale data were adjusted for the variation in movement between retail and wholesale prices for identical foods. Wholesale prices were also adjusted to approximate retail prices for clothing, fuel and light, furniture, tobacco, and spirits. The combined index for all items is a weighted arithmetic average of price relatives, using weights derived from the BLS consumer expenditure study of 1901–1902. No estimates were made for rent movements because of lack of data. For 1913–1926, the individual city indexes in the BLS "Cost-of-Living Index" were combined with city population weights.

E 186. Cost-of-living index (Rees), 1890–1914.

Source: National Bureau of Economic Research, *Thirty-eighth Annual Report*, New York, May 1958, pp. 59–60 (copyright).

Rees' cost-of-living index was based largely on retail prices. Douglas' estimates were adopted for food at retail, and tobacco and spirits at wholesale prices (see text for series E 185), but retail data were assembled to compute new components for fuel, rent, clothing, and housefurnishings. Prices for gas obtained from utility companies, and retail prices of kerosene as used for the New Jersey State cost-of-living index, were included in fuels. Wholesale prices of coal were included before 1907 and for kerosene before 1898. Rents for six cities were compiled from newspaper advertisements. Prices for clothing and housefurnishings were compiled from mail-order catalogs.

The index is a weighted average of price relatives, using weights derived largely from the BLS consumer expenditure study of 1901–1902.

E 187–202. Retail prices of selected foods in U.S. cities (BLS), 1890–1970.

Source: U.S. Bureau of Labor Statistics (BLS), 1890–1922, Bulletin 396, *Retail Prices, 1890 to 1924*, pp. 8–10; 1923–1934, BLS Bulletin 635, *Retail Prices of Food 1923–36*, pp. 77–89; 1935–1939, Serial No. R. 1172 (August 1940), *Retail Prices*, pp. 28–35; 1940–1970, annual or biennial bulletins, *Retail Prices of Food* (including Serial No. R. 1264, and Bulletins 707, 799, 899, 938, 965, 1032, 1055, 1141, 1183, 1217, 1254, 1301, 1446, and 1632).

While there were scattered statistics of prices of many individual commodities in various publications, it was not until 1901, when BLS began the collection of food prices on a regular basis, that a regular price collection program was initiated by the Federal Government. At that time, information was secured from dealers' books for 1890–1901. Since then, retail prices of food have been obtained by BLS, first at annual intervals, then monthly or semimonthly.

As the pricing program was expanded to other commodities and services purchased by families for daily living, the available resources and review of data requirements for the over-all Consumer Price Index (CPI) resulted in sampling and methodology changes for foods. The growth in importance of some foods and declines for others, changes in kinds and sizes of packages, different methods of preparation of foods for retail stores, and similar developments were taken into consideration in the adjustments made to the list of foods priced. Of the many foods included for most of the period since 1890, only 16 were selected for publication here.

The list of cites in which food prices were collected changed over the years. In the main, the cities covered were industrial localities in 30 to 40 States up to 1952. Beginning in 1953, the collection of food prices was restricted to the 46 cities included in the CPI. In 1964, pricing was extended to 50 areas. Six additional metropolitan areas were added in 1966 making the sample 56 metropolitan areas or urban places. See text for series E 135–166.

The number of stores in each city reporting food prices, after the initial collections through 1904, generally ranged from 25 in the larger cities to 15 in the smaller cities until 1932. Average prices for the United States were obtained by making simple averages of quotations from the total number of firms reporting for each food for 1915–1932. Average relative prices for each commodity were applied to prices in 1915 to estimate national averages for 1890–1914. Some chain stores were added to the samples as their sales volumes became significant in each city.

During 1932–1934 the store samples were expanded, particularly in the larger cities, and the method of averaging prices was adjusted to reflect food sales by chain and independent stores in each city. National averages were obtained by combining weighted city averages with the use of consumption and population weights. Refinements to the sampling and the weighting system have been introduced from time to time (see "Store Samples for Retail Food Prices," *Monthly Labor Review*, January 1947).

During the revision of the CPI in the late 1930's, comparable revised national averages were calculated back to 1923. The national averages shown here are those estimated by price relatives for 1890–1915, simple averages of quotations from all cities for 1916–1922, and weighted city averages beginning with 1923.

Food price data were collected by use of mail schedules and occasional personal visits until 1934. Since that year, all prices have been collected by personal visit of BLS representatives. Changes in descriptions for the foods priced, the cities covered, sizes and designs of samples of stores, and methods of processing introduce some noncomparabilities into the series.

Before the comprehensive CPI revision in 1964 BLS had published monthly city average retail food prices which were simply weighted means of the quotations used in the calculation of index numbers. However, the implementation of two recommendations of the Price Statistics Review Committee of the National Bureau of Economic Research concerning use of broader, less detailed specifications and the introduction of replicated samples resulted in data which could not be processed to meaningful average prices. Therefore, an estimating technique was adopted which takes advantage of the improved coverage resulting from broader specifications and those well-defined prices available. A set of average prices, called "benchmarks," is computed periodically, usually once a year, through the exclusion of all prices of items not meeting the exact requirements of a narrowly-defined specification. Once established, these benchmark prices are adjusted each month by the change in prices reflected in the index. A more detailed and technical explanation of this estimating procedure is available in "Calculation of Average Retail Food Prices," *Monthly Labor Review*, January 1965.

E 187, flour. Prices are for general all-purpose white wheat flour.

The size of package on which quotations were secured were: 1890–1928, 1/8 or 1/4 of a barrel although some smaller units were also included; 1929–1938, 12 or 24 lb. sack; 1939–1942, 5–12 lb. sack; 1943–1970, 5 lb. sack.

E 188, bread. Prices are for white bread, pan style, excluding all specialty type bread. For 1913–1936, prices were obtained from bakeries for 16 or 18 ounces in the dough and converted to 16 ounces baked weight. Both wrapped and unwrapped breads were included. Beginning in 1937, prices have been obtained primarily from grocery stores for the volume-selling size loaf of wrapped bread. The baked weight as given on the wrapper or reported by the store was converted to 16 ounces.

National averages have not been computed for 1890–1912. Prices for individual firms are available in the early retail price bulletins.

E 189, round steak. For 1890–1939, the averages include quotations for the best cut of the best grade handled in each store for whole round or top round, mostly bone-in. For 1940–1970, prices were for top round, bone-in, U.S. choice grade (comparable to U.S. good grade prior to the changes in grades by the Department of Agriculture in 1950).

E 190, chuck roast. For 1913–1939, quotations were reported for the best cut of the best grade handled in each store and include both bone-in and boneless. Since then, all quotations have been for "bone-in" roasts, The grade priced for 1940–1970 was the same as for round steak. Beginning in 1951, the more precise description of the cut was "blade pot-roast cut from upper part of shoulder before rib roast and behind neck, U. S. choice, bone-in."

National averages have not been computed for 1890–1912. Prices for individual firms are available in the early retail price bulletins.

E 191, pork chops. For 1890–1935, quotations were for loin chops of the best grade handled. Rib chops and chops from the thick end of the loin were excluded. From 1935 through May 1970, prices were obtained for center cut loin chops of U.S. No. 1 grade. Since May 1970, no grade has been specified.

E 192, bacon. Most of the quotations included in the average were for sliced bacon for all years. In the early years (probably before 1930) bacon was sliced when sold and prices for slab bacon may be included. Sliced and packaged bacon has been priced since about 1930 in 1 pound or two ½ pound packages of cellophane or similar material. Grade descriptions were: 1890–1942, best but not fancy grade; 1943–1945, first quality or fancy grade; 1946–1963, standard Grade A; since 1964, best quality.

E 193, butter. All prices refer to creamery butter, 92 to 93 score or better for 1890–1942 and 92 score for 1943–1970. Tub or print butter was priced up to 1940, roll or print in 1941 and 1942, package of 4 sticks or quarters for 1943–1946, and package print or roll, including quarters for 1947–1970.

E 194, eggs. Averages are for fresh eggs for all years. For 1890–1942, prices are for the highest grade sold in volume in each store; for 1943–1944, U.S. extras or Grade A; for 1945–1952, the highest grade and size sold in volume in each store; since 1953, large Grade A eggs in most cities, although some ungraded eggs included in some small cities.

E 195, milk, delivered. Until 1935, prices are for fresh fluid milk, raw or pasteurized, no grade designation, in quart bottle or in bulk, delivered to homes; for 1935–1946, raw or pasteurized milk of the dominant grade in each city in quart bottles or cartons; for 1947–1949, same grades, but sizes included 1-quart, 2-quart, and 4-quart containers in many cities: for 1950–1956, pasteurized milk, homogenized or nonhomogenized, without Vitamin D, of the volume-selling grade in each city in quart or half-gallon cartons or bottles; for 1957–September 1966, pasteurized, homogenized milk with Vitamin D added, 3.25 percent or over butterfat content in quart or half-gallon cartons or bottles; beginning in October 1966, prices are for half-gallon containers; since May 1970, prices are for fresh whole milk, pasteurized, homogenized, Vitamin D added.

E 196, oranges. California and Florida oranges of the variety and size constituting the bulk of sales each month were quoted from 1919 to about 1935. After that time, the size range was narrowed to include only size 176–220 in standard box of U.S. No. 1 grade (good quality).

E 197, potatoes. White or Irish potatoes, excluding large baking types, have been priced consistently for all years in the quantities in which sales have customarily been made. The designation of U.S. No. 1 grade was added in 1935.

E 198, tomatoes, canned. The volume selling brands of canned tomatoes, standard grade, in No. 2 can were priced for 1919–1954. For 1955–1970, the description was expanded to specify "small and large pieces, with a maximum of 50 percent liquid, standard grade (C)" and the can size was changed to No. 303. Prices for 1919–1954 have been converted to No. 303 can.

E 199, navy beans. Dried beans, white, navy, or pea beans, No. 1 choice, hand picked, packaged or bulk were priced for 1915–1970. For 1949–1952, California small white beans were also included and for 1953–1970, Great Northern beans.

E 200, coffee. For 1913–1970, whole bean or ground roasted coffee was priced. Bulk or packaged coffee was quoted up to 1938. For 1939–1955, coffee in cans, glass, cardboard, or paper containers were averaged. For 1956–1970, prices are for ground roasted coffee in airtight cans only.

E 201, margarine. Prices are for uncolored oleomargarine, animal and vegetable, in 1-pound cartons for 1919–1948. For 1949 and 1950, uncolored vegetable margarine in 1-pound cartons was quoted. For 1951–1970, averages are for colored vegetable margarine in 1-pound cartons.

E 202, sugar. Prices are for white granulated cane or beet sugar but the size package has varied over the years. For 1890–1916, prices for the volume-selling quantity were quoted; for 1917–1928, 1 pound; for 1929–1942, 10 pounds; and for 1943–1970, 5 pounds. For a short period during World War II, the 2-pound unit was the only one available.

E 203–213. General note.

The collection of retail prices for fuel and light was initiated in 1911 with coal and gas data for 1907–1911. After that time, the program was expanded to include gas, electricity, and the heating fuels used in important quantities in the cities covered. Prices were collected semiannually up to 1920 and at quarterly or monthly intervals from 1920 on. The indexes shown here are annual averages.

The number of cities for which prices for this group have been compiled has varied widely. Before 1947, city coverage had gradually been extended until fuels prices and utility rates were obtained in 51 cities. In 1947, this program was cut back to the 34 cities in the Consumer Price Index (CPI). The CPI revision in 1952 resulted in changing the city sample and enlarging the number to 46 cities. Another revision, effective in 1964, enlarged the sample to 50 urban areas. In 1966, six additional areas were included.

The changing importance of particular kinds of fuel in particular localities, coupled with the overall change in the area sample over the years, produced many changes in the volume of data for the indexes. The amount of supplementary information for deriving weights has varied also. In order to produce continuous index numbers, all changes in samples and methods of averaging were handled by the linking process.

All prices have been collected by mail from retailers and utility companies in each city, except reports for electricity which have been secured through the Federal Power Commission since 1937.

The terms of sale for the quotations were net cash payment basis, delivered to the residential consumer in specified quantities. Charges for special services were excluded, but all applicable sales taxes were included. Annual averages were computed using standard Bureau of Labor Statistics (BLS) procedures.

The following BLS bulletins contain the history of the collection and publication of prices for this group: Bulletin 664, *Changes in Retail Prices of Electricity, 1923–38*, pp. 17–19; Bulletin 628, *Changes in Retail Prices of Gas, 1923–36*, pp. 48–52; Bulletin 950, *Residential Heating Fuels; Retail Prices, 15.41–48*, pp. 1–4. These reports contain references to earlier bulletins and include other index and price series.

E 203. Retail price indexes **of** electricity for residential use, composite, **1913–1970.**

Source: U.S. Bureau of Labor Statistics (BLS), *Retail Price Indexes of Fuels and Utilities* (formerly *Fuels and Electricity) January 1972.*

See also general note for series E 208–218.

This composite is an extension backward of a current BLS series. For 1913–1934, the index is based on the average price per kilowatt-hour for the average amount of electricity used by families in each of the 32 cities included in the Consumer Price Index (CPI). Average prices for the 32 cities were combined as simple averages.

In 1938, a new method of computation for the revised CPI was inaugurated, and data were extended back to 1936. Net monthly bills for typical residential services were calculated from rate schedules for each city. The number of cities in the composite included 34 cities for 1935–1952, 46 cities for 1953–1963, 50 cities for 1964–1965, and 56 cities for 1966–1970.

Changes also have been made in the typical services. For the period 1935–1952, 25, 40, 100, and 250 kilowatt-hour monthly net bills were priced. From December 1952 to December 1963, three services were priced—40, 100, and 200 kilowatt-hours. With the revision of the CPI in 1964, the composite of services priced was changed to 100, 250, and 500 kilowatt-hours. The new composite included the entire 50-city sample for 1964 and 1965, and the entire 56-city sample for 1966–1970.

The net monthly bills for the typical services were first combined into an index for each city by using weights approximating the importance of each of the services in that city. The city indexes were then combined with the consumption and population weights of the CPI.

E 204. Retail price indexes **of** electricity for residential use, 100 kilowatt-hours, **1923–1970.**

Source: See source for series E 203.

See also general note for series E 208–218.

This index is based on net monthly bills for one, of the typical services included in the composite, series E 203. When the new method of calculation was inaugurated in 1938, net monthly bills were obtained from rate schedules supplied by the companies or in BLS files. Originally, the indexes were calculated on the 1923–25 base and converted to later base periods when the CPI was revised.

For 1923–June 1947, the cities in the series totaled 51 (including the 34 CPI cities). Thereafter, only CPI cities were included. The weights used for 1923–June 1947 represented the number of residential customers as of December 31, 1935. Since July 1947, the weights have been the CPI consumption and population factors.

E 205. Retail price indexes **of** gas for residential use, composite, **1935–1970.**

Source: See source for series E 203.

See also general note for series E 203–213.

This composite is another backward extension of a current BLS series. It combines data used to produce the indexes for "residential heating" and "other than residential heating."

When price collection for gas was begun by the BLS in 1911, the majority of the cities were served with manufactured gas. As a result of the increasing trend to use of natural gas, the number of cities for which the BLS obtained prices for manufactured gas declined from 35 of 39 cities in 1911 and 42 **of** 51 cities in 1923, to none of the CPI cities since 1957. While manufactured gas was being phased out, the use of natural gas increased. In 1913, only 8 or 9 of 50 cities were using natural gas; 18 of 50 cities were using natural gas in 1935, 33 of 46 cities in 1957, 49 of 50 cities in 1964, and 55 of the *56* CPI cities from 1966 to 1970.

The use of natural gas for residential heating grew in importance as additional pipelines made natural gas available to more and more cities. Although gas for residential heating was not included in the CPI before 1953, a special study in 1943 provided information on the volume of sales for residential heating as of 1940 and rate schedule data back to 1935 for cities in which natural gas was an important heating fuel.

In 1935, the BLS adopted the method of computing net monthly bills based on a definite number of heat units (therms of 100,000 British Thermal Units each) for each of 4 services—10.6, 19.6, 30.6, and 40.6 therms. These services were for use other than residential heating.

E 206. Retail price indexes of gas for residential heating, **1935–1970.**

Source: See source for series E 203.

See also general note for series E 203–213.

For the period 1935–1946, 27 of the **51** cities used for utility pricing were included in residential heating. For 1947–1952, 16 of **34** cities were included; for 1953–1963, 28 **of** 46 cities; for 1964–1965, 46 of 50 CPI urban areas; and, from 1966–1970, 50 **of** the 56 areas.

The price for each city was calculated as an average of the rates per therm in all of the heating rate blocks of the rate schedule, weighted by the total number of therms sold by the gas company in that rate block for residential heating. For 1935–1952, the average rates per therm for the various cities were then combined, using total thermal sales for residential heating in each city as weights. For 1953–1970, they were combined with consumption and population weights in the CPI.

E 207. Retail price indexes of gas for other than residential heating, composite, **1935–1970.**

Source: See source for series E 203.

See also general note for series E 203–213.

In 1935, BLS began pricing net monthly bills based upon a definite number of heat units (therms of 100,000 BTU each) for each of 4 selected services—10.6, 19.6, 30.6, and 40.6 therms. These 4 typical services were continued from 1935 through 1952. For 1953–1963, net monthly bills for 10 and 25 therms were used and, for 1964–1970, net monthly bills of 10, 25, and 40 therms. This method of calculating prices has provided a better measure of price changes since differences in heating values over time could be taken into account.

Indexes based on 10.6 and 30.6 therms back to 1923 and a description of the methods adopted in 1936 are included in BLS Bulletin 628, *Changes in Retail Prices of Gas.*

The number of cities included **was** 34 for 1935–1952 and 46 for 1953–1963. With the revised CPI of 1964, 49 of 50 cities were priced for gas other than residential heating, and, in 1966, this went to 56 of *56* CPI cities. For the methods of combining monthly bills used, see text for series E 203.

E 208. Retail price indexes **of** gas **for** other than residential heating, 10 therms, **1935–1970.**

Source: See source for series E 203.

See also general note for series E 208–218, and text for *E* 207.

For 1935–June 1947, the net monthly bill for 10.6 therms was computed for each city, and cities were combined on the basis of number of residential customers as of December 1946. For July 1947–1970, prices were obtained for 10 therms and city averages were combined with the consumption and population weights of the CPI.

Annual averages were estimated from quarterly figures for 1935–1951, and from monthly figures beginning in 1952.

E 209. Retail price indexes of gas for other than residential heating, 25 therms, 1935–1970.

Source: See source for series E 203.

See also general note for series E 203-213 and text for series E 207.

With the revision of January 1964, pricing of 25 and 40 therm net bills was initiated. Pricing occurred in 40 of the 50 CPI cities in December 1963 and was increased to 55 of 56 CPI cities when the CPI was expanded in December 1965. For frequency of collection and methods employed to combine city data, see text for series E 208.

E 210. Retail price indexes of fuel oil and coal for residential use, 1935-1970.

Source: See source for series E 203.

See also general note for series E 203–213.

This is a composite index combining consumption and population weights of fuel oil and coal used for the individual CPI commodities. In addition to fuel oil No. 2, the commodities priced for this index included, for varying periods of time, fuel oils No. 3 and No. 4, kerosene, anthracite, and bituminous coal. Pricing of petroleum fuels, other than fuel No. 2, was discontinued in 1964.

E 211. Retail price indexes of No. 2 fuel oil for residential use, 1935–1970.

Source: See source for series E 203.

See also general note for series E 203-213.

Retail prices of petroleum fuels were first collected in 24 cities in 1937 and data were obtained back to 1935. Thereafter, the number of cities was increased as fuel oil for heating became more important. Beginning in 1947, the city coverage was restricted to those included in the CPI and, through 1963, usually covered about 20 cities. For 1964 and 1965, 30 of the 50 CPI cities were covered and, from 1966 to 1970, 32 of 56 CPI cities were covered.

The prices from which the index was computed refer to prices per 100 gallons delivered in "the amount usually delivered at one time." No. 2 fuel oil has been priced continuously and, for 1939-1947, No. 3 oil also was priced and included. Average prices for each city were simple averages of quotations from a sample of dealers. For 1935–1938, city averages were combined with CPI consumption and population weights. For 1939-1946, weighting factors to combine city averages were obtained from 1941 shipments to each city as measured by Office of Price Administration rationing authorities. CPI weights were again employed after 1946 to obtain the US. averages.

E 212. Retail price indexes of Pennsylvania anthracite for residential use, stove size, 1913-1962.

Source: U.S. Bureau of Labor Statistics, *Retail Prices and Indexes of Fuels and Electricity*, December issues.

See also general note for series E 203-213.

Data for the early years by type of coal for each firm reporting were published in BLS Bulletin 105, *Retail Prices, 1890–1911.* Similar data for 1912-1917 are included in later issues of *Retail Prices.* Since the first collection, BLS has continuously obtained retail prices for all locally important fuels.

This index was based on average prices per net ton delivered at the curb or in the bin if there was no extra charge. Prices from dealers in each city always have been combined as a simple average for each city. For 1913-1928, city averages were combined also on an unweighted basis. Through a revision of method in 1936, city average prices for 1929-1952 were weighted by fixed weights based on anthracite shipments to each city by rail during the year ending July 1936. For 1953–1962, the city averages were combined with consumption and population weights of the CPI.

Cities for which anthracite prices were obtained varied partly because of change in consumer demand and partly due to CPI revisions. Generally the number of cities has declined until, with the revision of January 1964, indexes of retail prices for anthracite coal were no longer published.

E 213. Retail price indexes of bituminous coal for residential use, all domestic sizes, 1913-1962.

Source: See source for series E 212.

See also general note for series E 203-213.

For methods of collection and averaging of prices, see text for series E 212. Generally, the index was based on unweighted averages of all prices for all sizes and types of bituminous coal for 1913-June 1947, and on city averages weighted with CPI weighting factors for July 1947-1962. Publication of this series also was discontinued effective with the January 1964 revision of the CPI.

E 214. Rent indexes (Warren and Pearson) for dwelling units in 5 large cities, 1860-1880.

Source: George F. Warren and Frank A. Pearson, *Prices*, John Wiley and Sons, New York, 1933, p. 267 (copyright).

Chapter F

National Income and Wealth

National Product and Income (Series F 1-348)

F 1–348. General note.

In broad terms, national product or its equivalent, national income, is a comprehensive measure of the Nation's total annual production of commodities and services. Only the end products of a year's economic activity are included. For example, since the output of bread is included, the output of wheat used in producing the bread is excluded. At any given time, national product may be measured as the sum of the value added in various forms of economic activity (agriculture, mining, manufacturing, etc.); as the total of the incomes accruing to persons supplying different productive factors (wages and salaries, profits, including undistributed corporate profits, etc.); or as the aggregate value of the final products of the economy (food, clothing, shelter, etc.). While each of these approaches yields the same total (given a consistent scheme of valuation), the component detail illuminates different facets of the process of production, distribution, and consumption of the Nation's output, and, hence, serves different uses. These three approaches, of course, do not exhaust the possibilities.

Changes in national product may be measured either in current prices or in prices of a given year. In the latter case, the change ideally reflects only the change in the real volume of commodities and services. Each of these two forms of valuation has its particular uses. For example, in a study of financial developments or market trends, the current price series is often preferable, while for analysis of consumer levels of living or national productivity, the constant price series is more appropriate.

It may be useful to indicate briefly some of the more general conceptual limitations of national product estimates. First, national product is primarily a measure of the output of the market economy. Only a few items of "income in kind" are included. The most important are the value of food and fuel produced and consumed by farm families and the rental value of owner-occupied dwellings. No account is taken of items such as the value of the housewife's services or of home repairs, home dressmaking, or noncommercial recreation. Since economic growth generally involves a progressive commercialization of such activities, the increase of national product reflects to some extent a transfer of production from the nonmarket to the market sector rather than a real growth in the total volume of production.

Second, there is no complete agreement on all of the goods that may properly be considered end products of the economy. National product, as ordinarily constituted, includes, among other things, all items of consumer expenditure. This leads to the inclusion of such things as expenditures on transportation to work and payments to labor unions, which the consumer may not consider end products in themselves, but rather a necessary means under modern industrial organization to secure the money income needed to obtain goods that do constitute the goal of economic activity, such as food, clothing, and recreation. Also, since national product typically includes all government expenditure for commodities and services, criticism has been voiced regarding the inclusion of war and defense goods and government services to business, such as police and fire protection for factories and warehouses. If this argument is accepted, national product measures would be viewed as overstating the growth of the final product of the economy over time, since these items tend on balance to increase in relative importance as the economy develops.

Third, because of the techniques used in adjusting for price changes, national product in constant prices fails to reflect fully changes in the quality of goods during economic growth. In contrast to the foregoing limitation, this one would tend to understate the growth of national product, since, on the average, quality of products probably tends to improve over time.

Finally, national product may fail to measure accurately changes in the material level of living provided by economic activity, even when placed on a per capita basis, since the aggregate figures do not reflect changes in the distribution of income between rich and poor, in consumption needs arising from changes in the age composition of the population, or in man-hours spent in economic activity.

Despite these shortcomings of national product measures for historical analysis, there are wide areas of agreement on the proper means of constructing and interpreting such measures. Their usefulness in providing insights into the nature and growth of the economy is attested to by the wide acceptance of the figures.

The primary source for national income and product information is the *Survey of Current Business*, published monthly by the U.S. Department of Commerce, Bureau of Economic Analysis (formerly the Office of Business Economics). The most recent sources of the data presented here are the July 1973 issue of the *Survey; U.S. National Income and Product Accounts, 1964–1967;* and *The National Income and Product Accounts of the United States, 1929–1965.* Other principal works of a comprehensive nature that were used are: Simon Kuznets, *Capital in the American Economy: Its Formation and Financing*, National Bureau of Economic Research, New York, 1961, and "Long-Term Changes in the National Income of the United States of America Since 1870," in International Association for Research in Income and Wealth, *Income and Wealth of the United States: Trends and Structure*, Income and Wealth Series II, Bowes and Bowes, Cambridge, England, 1952; John W. Kendrick, *Productivity Trends in America*, National Bureau of Economic Research, New York, 1961; and Raymond W. Goldsmith, Dorothy S. Brady, and Horst Mendershausen, *A Study of Saving in the United States*, vol. III, Princeton University Press, 1956. Earlier works of historical nature are: Robert F. Martin, *National Income in the United States, 1799–1938*, National Industrial Conference Board, New York, 1939; Simon Kuznets, *National Income and Its Composition, 1919–1938*, National Bureau of Economic Research, New York, 1941, and *National Product Since 1869*, National Bureau of Economic Research, New York, 1946; *Enterprise and Social Progress*, National Industrial Conference Board, New York, 1939; Willford I. King, *The Wealth and Income of the People of the United States*, Macmillan, New York, 1915. A basic source for discussion of conceptual issues in the field is Conference on Research in Income and Wealth, *Studies in Income and Wealth*, vols. 1–38, National Bureau of Economic Research, New York, 1937–1960.

The extent of detail presented is limited by space requirements; greater detail is frequently available in the original source. No attempt was made to utilize estimates of contemporaries available for the 19th century, since these figures have not been subjected to critical review in the light of modern concepts and techniques. (See George Tucker, *Progress of the United States in Population and Wealth in Fifty Years*, Press of Hunt's Merchants' Magazine, New York,

1843; Ezra C. Seaman, *Essays on the Progress of Nations*, Charles Scribner, New York, 1868; *Annual Report of the Commissioner of Patents for the Year 1848;* David A. Wells, *Our Burden and Our Strength*, Loyal Publication Society, New York, 1864; Edward Atkinson, *The Distribution of Products*, New York, 1885; and Michael G. Mulhall, *Industries and Wealth of Nations*, Longmans, Green, London, 1896.)

The basic reference sources for concepts and methodology are *National Income, 1954 Edition; U.S. Income and Output, 1958;* the August 1965 issue of the *Survey of Current Business;* and *Readings in Concepts and Methods of National Income Statistics*, available from the U.S. National Technical Information Service, Springfield, Va.

F 1–5. Gross national product, total and per capita, in current and 1958 prices, 1869–1970.

Source: **Series F 1** and **F 3**, U.S. Bureau of Economic Analysis: 1869–1908, derived from Kendrick-Kuznets estimates published by John W. Kendrick in *Productivity Trends in the United States*, National Bureau of Economic Research, New York, 1961; 1909–1963, *The National Income and Product Accounts of the United States, 1929–65;* 1964–1970, *Survey of Current Business*, July issues, and later revisions by the Bureau of Economic Analysis. **Series F 2** and **F 4**, computed by dividing gross national product by population estimates in series A 1–2. **Series F 5**, computed by dividing the current price series of gross national product by the constant price series.

Gross national product, as defined by the Department of Commerce, is the market value of the output of goods and services produced by the Nation's economy, before deduction of depreciation charges and other allowances for business and institutional consumption of durable capital goods. Other business products used up by business in the accounting period are excluded. The Nation's economy in this context refers to the labor and property supplied by residents of the Nation. Gross national product comprises the purchase of goods and services by consumers and government, gross private domestic investment (including the change in business inventories), and net exports. See also general note for series F 1–348.

The current price estimates for 1909–1970 are the official estimates prepared by the Department of Commerce. For earlier years, gross national product estimates prepared by John W. Kendrick in terms of 1929 prices (see source cited above) were converted to 1958 prices by the Bureau of Economic Analysis (BEA) of the Department of Commerce. This was done by (1) taking the BEA 1958-base deflator for 1909 as a ratio of the Kendrick 1929-base deflator for 1909, (2) multiplying the Kendrick deflator series for 1869–1908 by the ratio, and (3) using the resulting 1958-base deflator series to deflate the Kendrick current dollar estimates into 1958 prices. For the years prior to 1909, the underlying estimates are those of Simon Kuznets, adjusted for 1889–1908 by John W. Kendrick to the same conceptual basis as the Commerce figures. The estimates for years before 1889 are in terms of the somewhat different Kuznets concept of gross national product. The specific nature of the conceptual differences is indicated below in connection with the discussion of series F 71–97. The constant price estimates at all dates are basically those of Simon Kuznets (see text for series F 98–124), but they have been adjusted to the Department of Commerce concept for 1889–1908 by Kendrick, who prepared constant dollar estimates for reconciliation items between the two series. The implicit price deflator is the ratio of gross national product in current prices to gross national product in constant prices. It is a weighted average of the price indexes used to deflate the components of gross national product, the implicit weights being expenditures in the current period.

With regard to statistical reliability, the Commerce estimates are considered to be "subject to only a small percentage of error." The same is very likely true of the estimates for 1919–1928, but for the years prior to 1919 the margin of error widens noticeably. For further discussion of the margin of error in the early estimates, see text for series F 71–97.

F 6–9. Net national product, national income, personal income, and disposable personal income, in current prices, 1897–1970.

Source: 1897–1928, computed by adjusting the gross national product totals (as shown in series F 1) by the estimated values of the items accounting for the difference between gross national product and the given aggregate. (See the reconciliation among the aggregates in series F 144–162.) The values of the reconciliation items are given in Raymond W. Goldsmith, Dorothy S. Brady, and Horst Mendershausen, *A Study of Saving in the U.S.*, vol. III, NBER, copyright by Princeton University Press, 1956, pp. 435 and 441. 1929–1970, U.S. Bureau of Economic Analysis: 1929–1963, *The National Income and Product Accounts of the U.S., 1929–1965;* 1964–1970, *Survey of Current Business*, July issues.

The following are definitions used by the Department of Commerce:

Net national product is the market value of the net output of goods and services produced by the Nation's economy. All business products used up by business in the accounting period are excluded. Net national product comprises the purchases of goods and services by consumers and government, net private domestic investment (including the change in business inventories), and net exports.

National income (sometimes called net national product at factor cost) represents the aggregate earnings of labor and property which arise from the current production of goods and services by the Nation's economy. Thus, it measures the total factor costs of the goods and services produced by the economy. Earnings are recorded in the forms in which they accrue to residents of the Nation, inclusive of taxes on those earnings. As such, they consist of the compensation of employees, the profits of corporate and unincorporated enterprises, net interest, and the rental income flowing to persons.

Personal income represents the current income received by persons from all sources, inclusive of transfers from government and business but exclusive of transfers among persons. Not only individuals (including owners of unincorporated enterprises), but also nonprofit institutions, private trust funds, and private health and welfare funds are classified as "persons." Personal income is measured on a before-tax basis, as the sum of wage and salary disbursements, other labor income, proprietors' and rental income, interest and dividends, and transfer payments, minus personal contributions for social insurance.

Disposable personal income is the income remaining to persons after the deduction from personal income of personal tax and nontax payments to general government.

Theoretically, net national product and national income are superior to gross national product as measures of the final output of the economy, since some duplication is involved by the inclusion in the latter of the production of fixed capital which serves merely for replacement purposes. However, the depreciation charges, taken as an approximation of the value of capital currently consumed in deriving net national product and national income, are largely in terms of original cost, and hence are on a basis of valuation not comparable to that of the gross production of fixed capital (see *National Income: 1954 Edition*, p. 43). In practice, therefore, the measures of the net product of the economy which are obtained are not fully satisfactory.

While net national product and national income are both measures of current national production (ideally, free from the duplication involved in gross national product), they differ in the manner in which this production is valued. Conceptually, in net national product, current production is valued at market prices, while in national income, it is valued at factor costs, that is, at the cost of the capital and labor used in producing it. In practice, as series F 144–162 shows, the principal difference between these two forms of valuation is indirect business taxes.

Personal income, which measures the actual current income receipts of persons from all sources, differs from the national income in that it excludes certain types of income which accrue in production but are not received by persons (for instance, the undistributed part of corporate profits) and, on the other hand, includes certain types of income which do not arise in current productive activity but constitute personal receipts (such as relief and unemployment benefits).

Hence, personal income, unlike the national product and national income aggregates, is not a measure of national production. Personal income net of taxes (i.e., disposable personal income) is the closest over-all statistical approximation to consumer purchasing power derived from current incomes.

The Department of Commerce figures (1929–1970) are believed to be subject to only a small percentage error. Personal income figures are more reliable than those for national income because the major items included in personal income (but not in national income) are reliable, and the exclusions either do not affect reliability or actually increase it.

For the years prior to 1929, the underlying estimates of gross national product are those of Simon Kuznets, adjusted by John W. Kendrick to the same conceptual basis as the Commerce figures for later years. The estimates for adjustments needed to move from gross national product to the series F 6–9 aggregates were made in a manner and from sources as closely comparable as possible with the Commerce figures. However, the estimates for these adjusting items "are probably affected by a larger margin of error for the period before 1929 . . . ." (*A Study of Saving* . . . vol. III, p. 424.)

F 10–16. Growth rates (percent) of gross national product and output per employee for the United States and six countries, 1870–1969.

Source: U.S. Bureau of Economic Analysis, *Long Term Economic Growth, 1860–1970.*

These growth rates are average annual percentage rates of change computed over the indicated periods by use of the compound interest rate formula. The gross national product (GNP) data from which the growth rates were computed are from two sources. Real GNP data for 1950–1969 are from the Organisation for Economic Cooperation and Development (OECD). The OECD defines GNP as the market value of the output of goods and services, free of duplication, produced by a country's economy before deduction of depreciation and other operating provisions. Where possible, the OECD has adjusted published country statistics to standard concepts and definitions, thereby obtaining better intercountry comparability. The GNP data used were published in *National Accounts of OECD Countries, 1953–1969* and *National Accounts of OECD Countries, 1950–1968* (Paris: OECD).

Gross national product data for 1870–1950 are from *Economic Growth in the West,* by Angus Maddison (Twentieth Century Fund, New York, 1964) and unpublished data supplied by the same author. Maddison adjusted data from various government and private sources to conform as closely as possible to the OECD definitions and to reflect present geographic boundaries. Wherever possible, Maddison based his data on gross domestic product, but both net and gross domestic and national product were used.

The data used to compute growth rates of output per employee were derived by dividing the GNP data by total civilian employment. Employment data for 1950–1969 are from *Labour Force Statistics, 1958–1969* and earlier editions of *Labour Force Statistics* (formerly *Manpower Statistics*) (OECD, Paris). The OECD defines a person as employed if he is above a specified age (varying among countries) and is either working or temporarily absent from his job. Employment data for 1870–1950 are from Maddison's *Economic Growth in the West.*

The per capita gross national product data used to compute growth rates were derived by dividing the GNP data by population. The population data for 1950–1969 are from the OECD, which defines population to include all nationals present in or temporarily absent from the country and aliens permanently settled in the country. These data are from the same OECD publications as the employment data above. Population data for 1870–1950 are from Maddison's *Economic Growth in the West.* Maddison adjusted country estimates to refer to constant territory.

F 17–30. Per capita income and product for selected items, in current and constant (1958) prices, 1929–1970.

Source: 1929–1970, U.S. Bureau of Economic Analysis, *Survey of Current Business,* July 1973, table 7.6.

See text for series F 1–5, F 6–9, and F 47–70 for definitions of major aggregates. Personal income and disposable personal income in constant prices are derived by deflating the totals in current prices by the implicit price deflator for personal consumption expenditures.

F 31. Average annual growth rates of gross national product (percent), 1909–1970.

Source: U.S. Bureau of Economic Analysis, *Long Term Economic Growth, 1860–1970,* and unpublished data.

This series represents average annual percentage rates of change, or growth rates, in real (constant dollar) gross national product for all combinations of years in the period 1909 to 1970. These growth rates were computed from Department of Commerce estimates of real gross national product (in 1958 dollars) by means of the compound interest rate formula.

See general note for series F 1–348 and text for series F 1–5.

F 32–46. Gross national product—summary in current and constant (1958) prices, 1929–1970.

Source: U.S. Bureau of Economic Analysis, 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965;* 1964–1970, *Survey of Current Business,* July issues, tables 1.3, 1.5, 1.7, and 1.8.

The gross national product classifications shown in series F 32–46 are of output by major type of product—durable goods, nondurable goods, services, and structures; and output by sector of origin—business (farm and nonfarm), households and institutions, general government, and the rest of the world.

Output by major type of product provides type-of-product information on a consistent basis for the gross national product as a whole and represents regroupings of the estimates of expenditures by the major market groups.

The categories shown are defined as follows:

Durable goods—Sum of purchases of durable goods by business (producers' durable equipment), persons, government (Federal, State and local), of exports minus imports of these goods, plus an allowance for change in business inventories of durable goods.

Nondurable goods—Sum of purchases of nondurable goods by persons and general government, of exports minus imports of these goods, and an allowance for change in business inventories of nondurable goods.

Services—Sum of purchases of services by persons, of public purchases from business and from government employees (as measured by their compensation), and of exports minus imports of services.

Structures—Sum of new private construction and new public construction.

The classification by sector of origin shows the same total of gross national product derived by summing the gross product originating in the particular sectors of the Nation's economy: farm and nonfarm business and three nonbusiness groups—households, government, and the rest of the world. For the current dollar estimates, the output of the three nonbusiness sectors is measured by the incomes originating in them. The contribution of the farm business sector is estimated as the total value of farm products less farmers' cost purchases from nonfarm business. The resulting measure of output is, in principle, equal to the sum of income derived from farm production plus certain other charges, mainly indirect business taxes and depreciation. The total of these measures of output originating is deducted from the total gross national product as measured by the sum of final expenditures to obtain nonfarm business gross product as a residual.

The constant dollar measures are derived in the same general framework. The real gross product of farming is estimated by the separate deflation of product values and cost purchases, each in con-

siderable detail. The real output of government is measured in terms of deflated labor input, without allowance for changes in productivity. Real income from foreign investment is obtained by deflating the current-dollar flows by composite price indexes that measure changes in the purchasing power of these flows in foreign trade transactions. The real product of households and institutions reflects labor input. The nonfarm business component is then derived as a residual.

F 47–143. General note.

These series provide a summary view of the end products of the economy. From these data one can determine, among other things, to what extent the annual flow of production took the form of consumers' goods, on the one hand, and capital goods, on the other. In addition, one can examine the composition of the flow of goods to consumers (in terms of broad categories such as services, nondurable goods, and durable goods), and of capital formation, classified according to types such as construction, producers' durable equipment, etc.

F 47–70. Gross national product, by type of expenditure, in current and constant (1958) prices, 1929–1970.

Source: U.S. Bureau of Economic Analysis, 1929–1963, *National Income and Product Accounts of the United States, 1929–1965;* 1964–1970, *Survey of Current Business,* July issues, tables 1.2 and 1.8.

The following are definitions used by the Department of Commerce (for the definition of gross national product, see text for series F 1–5):

Personal consumption expenditures (series F 48–51) represent the market value of purchases of goods and services by individuals and nonprofit institutions and the value of food, clothing, housing, and financial services received by them as income in kind. It includes the rental value of owner-occupied houses but does not include purchases of dwellings, which are classified as capital goods. Consumer durable commodities are generally defined as those having an average life of 3 years or longer.

Gross private domestic investment (series F 52–62) consists of net acquisitions of fixed capital goods by private business and nonprofit institutions including commissions arising in sale and purchase of new and existing fixed assets, principally real estate, and of the value of the change in the volume of inventories held by business. It covers all private new dwellings, including those acquired by owner occupants. Producers' durable equipment is defined in terms of items having an average life of one or more years.

Net exports of goods and services (series F 63–65) measures the balance on goods and services, excluding transfers under military grants, as reported in the U.S. balance of payments statistics.

Government purchases of goods and services (series F 66–70) are made up of the net expenditures on goods and services by the three levels of government—Federal, State, and local—and the gross investment of government enterprises. Among the items included in government purchases of goods and services are: Compensation of government employees; construction expenditures on highways, bridges, and schools; and net purchases of equipment and supplies from business and abroad. Excluded from this category are purchases for the acquisition of land, current outlays of government enterprises, transfer payments, government interest, subsidies, and transactions in financial claims.

National defense purchases (series F 68) include Department of Defense military functions, military assistance to other nations, development and control of atomic energy, and stockpiling of strategic materials.

The figures are official Department of Commerce estimates. With regard to the relative accuracy of the different product series, the Department states that government purchases of goods and services, particularly Federal Government purchases, is highest on the scale of reliability, while the change in business inventories (which includes an inventory valuation adjustment) is lowest. Lying between these extremes are, in order of decreasing accuracy: Producers' purchases of durable equipment and personal consumption expenditures for durables and nondurables; personal consumption expenditures for services; and new construction. While the estimate of net exports is based on a good deal of statistical information, it is nevertheless liable to substantial percentage error because it is derived as the difference between much larger numerical values.

Constant prices.—These data represent estimates in 1958 prices for the current price series presented in series F 47–70. The general procedure followed by the Department of Commerce was to divide the current price figures (organized in a product breakdown much finer than that shown) by appropriate price indexes based on 1958 = 100. The price indexes used in deriving the 1958 price estimates do not generally allow for quality change. Therefore, the constant price figures do not reflect part of the secular quality improvement in the economy. Also, the constant-price series overstate somewhat short-run fluctuations in output, because available price information understates effective short-run fluctuations in prices. The choice of a recent year price base rather than an earlier year base (for example, 1929) to derive the constant price estimates tends to reduce somewhat the magnitude of the long-term growth in gross national product.

F 71–97. Gross and net national product, by major type of product, in current prices, 1869–1931.

Source: Simon Kuznets, *Capital in the American Economy: Its Formation and Financing,* National Bureau of Economic Research, New York, 1961 (copyright).

The difference between the gross national product series presented in series F 71 and the Department of Commerce series in series F 1 and F 32 is primarily conceptual, and relates almost wholly to the treatment of government in the estimation of national product. In series F 71, government purchases of goods and services is omitted as a component of gross national product. However, an estimate of government services to consumers is added to personal consumption expenditures to obtain an estimate of "flow of goods to consumers" and government capital formation (consisting of both war and nonwar public construction, purchases of durable equipment including durable munitions, and the change in the stock of monetary metals) is added to private capital formation. In addition, series F 71 excludes from flow of goods to consumers and from gross national product the imputed value of unpaid services of financial intermediaries.

The effect of these adjustments is to yield a lower aggregate for gross national product, chiefly because government expenditures which are considered not to take the form of services to consumers or capital formation are omitted from the total. In effect, these omitted expenditures are treated as yielding intermediate services that facilitate the flow of goods to consumers or capital formation, but do not in themselves constitute final products, just as the production of wheat contributes to the production of bread but is not counted as a final product in addition to bread. For the earlier years, the quantitative difference between the two series (F 1 and F 71) arising from this conceptual difference is fairly small, but for the most recent decades (since 1940) it would be quite large, because of the great relative expansion in Government expenditures for military and defense purposes, which in the Kuznets concept are largely excluded from the total.

Net national product differs from gross national product in that an allowance for capital consumed during the year in the process of production has been deducted from the gross national product total. In the present case, capital consumption, both private and public, is valued at reproduction cost. Thus, a piece of equipment used up during the current year is valued at the current cost of replacement irrespective of the original cost of the equipment. In addition, the capital consumption estimate includes an allowance for depletion of natural resources.

The differences between the present series and the Department of Commerce series with regard to the major components (that is, between personal consumption expenditures and flow of goods to consumers, and between gross private domestic investment and private and public capital formation) have been indicated above in the discussion of the differences in the gross national product con-

cepts. Consumer perishables, semidurables, and durables are commodities that, without marked change and retaining their essential physical identity are ordinarily employed less than 6 months, from 6 months to 3 years, and more than 3 years, respectively.

With regard to the statistical reliability of the estimates, the following quotation, relating to decade rather than the quinquennial averages presented here, is relevant:

> For the comprehensive totals of national product and their major components, such as flow of goods to consumers, gross value of producer durables, gross construction, the maximum error in the estimates for the decades before 1919 can be said to be 15 percent; for the later three decades [1919–28, 1924–33, 1929–38] less than 10 percent. The maximum errors may be somewhat larger for the various categories of the flow of goods to consumers; and, on a percentage basis, much larger for the net totals—net producer durables, net construction, changes in inventories, changes in claims against foreign countries, particularly the last two.
>
> Owing to possible shortages in the underlying data or errors inherent in some of the assumptions, the comprehensive totals for the 1869–78 decade may be understated by as much as 10 percent; for the 1874–83 decade by as much as 5 percent; for the subsequent decades through 1899–1908 by as much as 2 to 3 percent. (Simon Kuznets, *National Product Since 1869*, National Bureau of Economic Research, New York, 1946, pp. 85–86.)

This statement, though made with respect to an earlier set of estimates, is also applicable to the revised figures presented here, but since the present estimates refer to quinquennial periods, the allowance for maximum error should be increased.

F 98–124. Gross and net national product, by major type of product, in 1929 prices, 1869–1931.

Source: See source for series F 71–97.

See also text for series F 71–97.

These series are exact counterparts of series F 71–97, except that the estimates are expressed in 1929 prices instead of current prices.

The estimates were derived as follows: For commodity production, the current dollar estimates used in deriving series F 71–97, but in the narrowest categories that production statistics permitted, and at producers' prices, were deflated by price indexes for corresponding product groups. The resulting estimates of commodity output in 1929 prices were then adjusted upward by a constant ratio to allow for transportation and distributive margins, thus yielding commodity output at final cost to consumers. The current dollar estimates of services included in series F 71–97 were deflated by the implicit average price index for all consumer commodities, except in the case of rent, which was deflated by a specific rent index.

The discussion of margins of error with regard to series F 71–97 applies here also, except that the deflation procedure increases the possible error somewhat. In particular, since the price indexes used for deflation do not adequately allow for quality change or new goods, an element of downward bias is introduced that is not present in the current dollar estimates.

F 125–129. Gross domestic product originating in private farm and nonfarm sectors and government, in 1929 prices, 1869–1960.

Source: John W. Kendrick, 1869–1955, *Productivity Trends in the United States*, National Bureau of Economic Research, New York, 1961 (copyright); 1956–1960, unpublished data.

Gross domestic product in series F 125 differs from gross national product in series F 3 in that the former excludes net factor income from abroad. Thus the return on capital located abroad but owned by United States residents is excluded, while the income from capital owned abroad but located in this country is included. Quantitative differences in the two series are also due to the valuation periods used.

Kendrick derived these estimates as follows: His gross national product series in 1929 prices was adjusted by a constant price estimate of net factor income from abroad to obtain gross domestic product. A constant dollar estimate of gross farm product was derived as the difference between constant dollar estimates of the total value of farm output and of the value of intermediate products consumed. This procedure is preferable to the more common one of taking the physical outputs of an industry and weighting them by unit values in the base year. The latter procedure yields a measure that includes purchases from other industries, and the figures for a number of industries cannot be summed without duplication. For example, assume that the output of artificial fertilizers was to increase and to cause higher yields in agriculture; the effect on the combined output of agriculture and manufacturing (which would include the manufacture of artificial fertilizers) would be exaggerated if the individual sector estimates were derived without allowance for changes in the constant dollar value of purchases from other sectors.

"Farm," as used in series F 127, differs slightly from "agriculture" in series F 227 in that F 127 excludes agricultural services, forestry, and fisheries.

Gross government product, in accordance with present Department of Commerce concepts, consists of a deflated series on compensation of general government employees. The deflation procedure used does not allow for changes in the productivity of these employees.

Gross private domestic product was obtained as the difference between gross domestic product and gross government product. Gross nonfarm product is the difference between gross private domestic product and gross farm product.

The reliability of gross domestic product is essentially the same as that of gross national product, from which it was derived (see text for series F 1–5). While the estimates for farm and government product, the two directly estimated components, are probably less accurate, they are nevertheless based on fairly satisfactory sources, even for the earlier dates.

F 130–143. Gross national product, by type of industry, in current and constant (1958) prices, 1947–1970.

Source: U.S. Bureau of Economic Analysis, 1947–1966, *U.S. National Income and Product Accounts, 1964–67*, tables 1.21, 1.22, 1, and 2; 1967–1970, *Survey of Current Business*, July issues, tables 1.21 and 1.22.

As indicated in the general note for series F 1–348, the national output total (GNP) may be obtained by several methods. The gross national product by industry series, in contrast to others, emphasizes the industrial origin of the gross product and shows an industry's (agriculture, manufacturing, retail trade, etc.) contribution to the Nation's total output of goods and services, as measured within the framework of the national income and product accounts.

Gross product originating in an industry, its value added, may be measured as the difference between the value of an industry's total output in producers' prices and the cost of materials and business services purchased by the industry at delivered prices. The same total may also be calculated by summing the industry's payments to the factors of production (employee compensation, profits, etc.) and its nonfactor costs (depreciation, property tax, sales tax, etc.). The sum of the gross products of all industries is equal to the Nation's total output of goods and services or GNP.

The current-price measures of gross national product by industry given in series F 130–143 are obtained by distributing and summing by industry the income payments to the factors of production and the nonfactor costs of production. In these distributions profit-type income and capital consumption allowances are adjusted to represent establishment totals. The estimates are valued at market prices and are consistent with other measures of GNP. The industry classification used conforms to the 1957 edition of the *Standard Industrial Classification (SIC) Manual.*

The statistical discrepancy entry in the current dollar series is the excess of the value of the estimated gross national product as computed by adding the expenditure components over its independently estimated value as computed by adding the factor income shares and the various nonfactor charges. This discrepancy is also included in the "residual" appearing in the constant price series and is a partial explanation of the reason why total real GNP measured by final

purchases differs from the total real GNP measured by the gross product originating in industry.

Two methods were used in deriving industry gross product in constant prices. In one, implicit price deflators for industry gross product were calculated and applied to the current price gross product for the industry. Under the second method, a series was developed representing the annual index of the industry's real gross product. This index was then used to extrapolate the industry gross product for the base year—1958.

These alternative methods were used because, in general, it was not possible to calculate current price measures of industry total output and intermediate purchases that are necessary in order to apply the traditional "double-deflation" technique.

The methods employed to calculate real product by industry are described in detail in *GNP by Major Industries, Concepts and Methods*, a pamphlet available upon request from the Interindustry Economics Division, Bureau of Economic Analysis. The article "GNP by Major Industries" in the October 1962 *Survey of Current Business* also discusses in detail special qualifications applicable to deflators for the construction, services, and government industries. The latter article also discusses how the data shown in these tables may be used to examine the cost-profit structure underlying the industry and its overall price indexes.

F 144–162. Relation of gross national product, national income, and personal income and saving, 1929–1970.

Source: U.S. Bureau of Economic Analysis, 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965;* 1964–1970, *Survey of Current Business*, July issues, tables 1.9 and 2.1.

Series F 144–162 is designed to show the precise relationship among the various national account aggregates. The major aggregates of gross national product, net national product, national income, personal income, and disposable personal income are defined in the text for series F 1–5 and F 6–9. *Personal saving* (series F 162) is defined as the excess of personal income over the sum of personal outlays and personal tax and nontax payments. It consists of the current saving of individuals (including owners of unincorporated businesses), nonprofit institutions, and private health, welfare, and trust funds. Personal saving equals the change in the net worth of persons which may be further viewed as the acquisition of financial claims (such as cash and deposits, securities and reserves of life insurance companies and non-insured pension funds) less the net increase in indebtedness, plus the acquisition of physical assets net of capital consumption allowances.

F 163–185. National income, by type of income, 1929–1970.

Source: U.S. Bureau of Economic Analysis, 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965*; 1964–1970, *Survey of Current Business*, July issues, table 1.10.

For the definition of national income, see text for series F 6–9. Other definitions used by the Department of Commerce are as follows:

Compensation of employees is the income accruing to persons in an employee status as remuneration for their work. It is the sum of wages and salaries and supplements to wages and salaries. *Wages and salaries* consists of the monetary remuneration of employees, inclusive of executives' compensation, commissions, tips, and bonuses, and of payments in kind which represent income to the recipients. *Supplements to wages and salaries* consists of employer contributions for social insurance and of other labor income. Employer contributions for social insurance comprises employer payments under the social security, Federal and State unemployment insurance, railroad retirement and unemployment insurance, government retirement, and a few other minor social insurance programs. Other labor income comprises employer contributions to private pension, health, unemployment, and welfare funds; compensation for injuries; directors' fees; pay of the military reserve; and a few other minor items.

Proprietors' income measures the monetary earnings and income in kind of sole proprietorships, partnerships, and producers' cooperatives from their current business operations—other than the supplementary income of individuals derived from renting property. It includes the inventory valuation adjustment and the other adjustments to taxable income described under corporate profits.

Rental income of persons consists of the monetary earnings of persons from the rental of real property, except the earnings of persons primarily engaged in the real estate business; the imputed net rental returns to owner-occupants of nonfarm dwellings; and the royalties received by persons from patents, copyrights, and rights to natural resources.

Corporate profits (before tax) and inventory valuation adjustment is the earnings of corporations organized for profit which accrue to residents of the Nation, measured before Federal and State profits taxes, without deduction of depletion charges, exclusive of capital gains and losses and intercorporate dividends, and including inventory valuation adjustment (the inventory valuation adjustment adjusts book cost of goods sold to replacement cost of goods sold in the computation of profits). It includes the profits of stock life insurance companies and of mutual financial institutions. Bad debt expenses are measured by actual losses, not additions to reserves; and the profit or loss of bankrupt firms includes the gain from unsatisfied debt. Corporate profits includes net receipts of dividends and branch profits from abroad, as reflected in the balance of payments statistics, in addition to profits earned in domestic operations. In other major respects, the definition of profits is in accordance with Federal income tax regulations.

Net interest measures the excess of interest payments of the domestic business system over its interest receipts, plus net interest received from abroad. In addition to monetary interest flows, net interest includes imputed interest arising in connection with the operations of financial intermediaries.

The figures are official Department of Commerce estimates. The relative accuracy of the various series as evaluated by the Department is, in terms of decreasing reliability: Employee compensation, corporate profits, net interest, proprietors' income, and rental income. In particular, the entrepreneurial income estimates (including rental income) are subject to significant shortcomings when compared with the other income shares.

F 186–191. Percent distribution of national income, by type of income, in current prices, 1900–1969.

Source: 1900–1939, D. Gale Johnson, "The Functional Distribution of Income in the United States, 1850–1952," *Review of Economics and Statistics*, vol. XXXVI, No. 2, May 1954, p. 178 (copyright, Harvard College); 1930–1969, U.S. Bureau of Economic Analysis, unpublished data.

The Commerce data for series F 186–191 were compiled by the Bureau of Economic Analysis from data published in the *National Income and Product Accounts of the United States, 1929–1965*, and subsequent July issues of the *Survey of Current Business*. The definitions for these series are the same as those given for series F 163–185.

D. Gale Johnson carried the Department of Commerce estimates (series F 163–185) back to 1900 on the basis of Kuznets' estimates for 1919–1928; King's for 1909–1918; Martin's for 1899–1908; and certain other sources. (Simon Kuznets, *National Income and Its Composition, 1919–1938*, National Bureau of Economic Research, New York, 1941; Willford I. King, *The National Income and Its Purchasing Power*, National Bureau of Economic Research, New York, 1930; and Robert F. Martin, *National Income in the United States, 1799–1938*, National Industrial Conference Board, New York, 1939.)

The procedures followed are summarized by Johnson as follows:

For the period 1910–1928, the Bureau of Agricultural Economics estimates of farm operators income is used. The estimate of corporate profits is taken from a series of net profits after taxes published by the National Industrial Conference Board to which is added the amount of corporate taxes paid. Kuznets series for wages and salaries, nonfarm entrepreneurial income, and rent were accepted

as published for 1919–1928. His interest series is substantially below that of the Department of Commerce after interest paid by governments is eliminated. It was linked with the Department of Commerce series in terms of average relationship for the period 1929–1933. The estimates of King for 1909–1918 and Martin for 1899–1908 were adjusted in a similar fashion.

Definitions for the Johnson data are the same as those for F 163–185, except that prior to 1929 corporate profits before taxes (series F 190) does not include an inventory valuation adjustment, and income of unincorporated enterprises (series F 188) includes one only for farm income. Also, imputed interest is not included in the series used to extrapolate the Department of Commerce estimates of net interest prior to 1929.

See text for series F 163–185 for reliability estimate of the Department of Commerce data. For the years prior to 1929, and particularly before 1919, the general level of reliability of all series is less than for the later period.

F 192–209. National income, by sector and legal form of organization, 1929–1970.

Source: U.S. Bureau of Economic Analysis, 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965;* 1964–1970, *Survey of Current Business,* July issues, table 1.13.

These series present an allocation of national income by type of income among seven legal forms of organization. These include three groupings of private business enterprises, namely, corporations, sole proprietorships and partnerships, and other private business; two major groupings related to government activities, government enterprises (covering the essentially commercial enterprises of the government, such as the U.S. Postal Service) and general government; private households and nonprofit institutions; and a sector that provides a measure of the net income originating in the rest of the world which accrues to U.S. residents.

Certain types of income, by definition, fall into one of the seven legal forms of organization distinguished in these series, such as corporate profits, proprietors' income, and rental income of persons. Net interest is estimated separately for each of the relevant legal forms, and a breakdown of compensation of employees among the three forms of private business enterprises is derived for benchmark years by applying distributions for each industry developed largely from economic censuses. A description of the various types of income may be found in the text for series F 163–185.

F 210–215. Percent distribution of aggregate payments, by type of income, in current prices, 1870–1968.

Source: Department of Commerce estimates, U.S. Bureau of Economic Analysis, unpublished data; other estimates, Simon Kuznets, "Long-Term Changes in the National Income of the United States of America Since 1870," in International Association for Research in Income and Wealth, *Income and Wealth of the United States: Trends and Structure,* Income and Wealth Series II, Bowes and Bowes, Cambridge, England, 1952, p. 136.

The Department of Commerce estimates were compiled by the Bureau of Economic Analysis from national income data published in *The National Income and Product Accounts of the United States, 1929–1965,* and subsequent July issues of the *Survey of Current Business.*

See text for series F 163–185 for definitions underlying the Department of Commerce series. Two modifications have been introduced to maintain comparability with the Martin and Kuznets series—corporate profits other than dividends have been deducted and government interest has been added.

These series provide a somewhat longer historical perspective than do series F 163–185 and F 186–191 on the distribution of income by type, chiefly by drawing on an earlier study by Willford I. King, *The Wealth and Income of the People of the United States,* Macmillan, New York, 1919. However, the reliability of these earlier figures is uncertain, as is clear from the following statement accompanying presentation of the table in the source:

> [The following table] assembles the information available on [the] distribution of aggregate payments by type for the period under consideration. W. I. King's figures are of somewhat doubtful usefulness in this connection, since the treatment of corporate and government savings is not clear from his analysis, and the statistical basis for the estimates is quite thin. Although Martin's figures are on a somewhat more secure basis, the differences in level between [the overlap values for 1909–1918] indicate lack of comparability with the more acceptable estimates for recent decades. One must, therefore, pick one's way with caution in any attempt to infer long-term changes in the distribution of income payments by type.

These series are based on a somewhat different aggregate than those in series F 163–185 and F 186–191, the most important difference being that the "aggregate payments" concept includes only corporate dividends rather than corporate profits before taxes. Hence, corporate profits tax liability, undistributed corporate profits, and the corporate inventory valuation adjustment are all excluded from the total underlying series F 210. In addition, the interest series includes government interest and excludes imputed interest (though in bringing the National Bureau of Economic Research series up to date by means of the Department of Commerce data, a series including imputed interest was used). With regard to the remaining three series (employee compensation, entrepreneurial income, and rent), the underlying concepts correspond closely to their counterparts in series F 164, F 174, and F 177, though the statistical procedures followed differ somewhat.

F 216–225. Percent distribution of national income or aggregate payments, by industry, in current prices, 1869–1968.

Source: See series F 210–215, p. 89.

The basic estimates used in deriving the earlier series are those of Robert F. Martin, *National Income in the United States, 1799–1938,* National Industrial Conference Board, New York, 1939; and Simon Kuznets, *National Income and Its Composition, 1919–1938,* National Bureau of Economic Research, New York, 1941. The Kuznets series was extended through 1948 on the basis of appropriately adjusted Department of Commerce figures. The Department of Commerce estimates were compiled by the Bureau of Economic Analysis from national income data published in *The National Income and Product Accounts of the United States, 1929–1965,* and subsequent July issues of the *Survey of Current Business.*

The Kuznets measure of income originating in an industry differs somewhat from that employed in the published Department of Commerce estimates, series F 226–237, corporate taxes having been excluded and interest on government debt included. Also, in the Martin series on "aggregate payments," undistributed corporate profits are not included. Hence, aside from variations in statistical technique and sources, the income totals differ somewhat for the years where the three sets of estimates overlap.

Also, there is some variation in industrial classification. The finance and miscellaneous category in the National Bureau of Economic Research estimates includes items such as income originating in fisheries and in bus, truck, and air transportation, and dividend and interest flows from the rest of the world. In the Martin estimates this category also includes income from fisheries and the net international flow of interest and dividends, as well as income from miscellaneous professional occupations, such as the clergy, and from the hand trades. (In the other two sets of estimates these last two categories are classified in the service sector.) Also, in the Martin estimates shown in the last three lines of series F 216–225, rents are distributed among the various industries, whereas, in the estimates for all other years, they are classified under the "finance" sector.

The Department of Commerce series shown for the period 1929 through 1968 has been adjusted to conform to the Kuznets series, i.e., government debt interest has been included, corporate profits taxes have been excluded, and the industry classifications have been adjusted somewhat.

The comments made in connection with series F 226–237 regarding variations in the statistical reliability of the estimates for the different sectors are relevant here. (See also *National Income and Its Composition, 1919–1938*, pp. 509–523.) Also, the Martin estimates, particularly for the dates prior to 1899, should be considered of a definitely lower order of reliability.

F 226–237. National income, by industrial origin, in current prices, 1929–1970.

Source: U.S. Bureau of Economic Analysis, 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965*; 1964–1970, *Survey of Current Business*, July issues, table 1.12.

The income total used in this distribution is that of national income (see text for series F 6–9). The industrial classification for 1929–1948 follows closely that of the 1942 Standard Industrial Classification System (for a comparison applicable to this period, see *National Income: 1954 Edition*). The classification for 1948–1970 is based upon the 1957 Standard Industrial Classification. Estimates for 1948 are provided by both classifications so that users may gauge the comparability of data for the earlier and later periods. It should be noted that all establishments operated by government agencies or corporations are classified in the government and government enterprises industrial division, regardless of their classification in the Standard Industrial Classification System.

In the discussion of series F 163–185, it is noted that there are differences in the reliability of the estimates for various *types* of income, and, in particular, that the estimates for proprietors' income and for rental income are of a much lower order of accuracy. This information may be used to draw some inferences concerning the relative accuracy of the industry estimates, since, generally speaking, the estimates for those sectors in which the least reliable types of income bulk large will be lowest in statistical accuracy. Accordingly, the estimates for the construction, trade, and service sectors should be considered least reliable, since in each of these, proprietors' income accounts for a disproportionately large share. The estimate for the sector labeled "finance, insurance, and real estate" should also be included in this category, because rental income is of preponderant importance. The most reliable estimates are those for mining, manufacturing, transportation, communications and public utilities, and government, while those for agriculture would probably rank somewhat below these, but noticeably above the least reliable group.

F 238–249. Value added by selected industries, and value of output of fixed capital, in current and 1879 prices, 1839–1899.

Source: Robert E. Gallman, "Commodity Output in the United States, 1839–1899," Conference on Research in Income and Wealth, *Studies in Income and Wealth*, vol. 24, National Bureau of Economic Research, New York, 1960 (copyright).

Value added in agriculture, mining, manufacturing, and construction, though narrower in scope than national product, is the most reliable output series of fairly comprehensive coverage for the period prior to 1870. "Value added" is the value of output, at producers' prices, less the value of commodities consumed in production, at delivered prices. Viewed from the income side, it comprises for any given sector the sum of payments to factors of production (net income originating), payments made to noncommodity producing firms (including government, but excluding transportation), and depreciation. Generally speaking, the coverage of the total for the four sectors combined is fairly close to that for finished commodity output plus construction materials (see also text for series P 318–374). It differs from gross national product primarily in that it excludes the value of transportation and distributive services and of services to ultimate consumers, such as medical and educational services, and refers to the product produced within a given area rather than that accruing to the residents of the area.

The series for agriculture includes the value of food, fuel, and manufactures produced and consumed on the farm; that for mining excludes the output of precious metals mining; and that for manufacturing excludes home manufactures and the products of the independent hand trades. Forestry and fisheries are not covered in any of the series.

Estimates in constant prices were obtained for each sector as the difference between the constant price estimates of the total value of the output of the sector and of the value of intermediate products consumed.

The series on value of output of fixed capital covers the value of construction, manufactured producers' durables, and farm improvements. The value of repairs and maintenance is included only in the estimates for construction. Fixed capital produced by the independent hand trades—chiefly artisans' tools and agricultural implements—is not included. The figures relate to output, not domestic use. Constant price estimates were obtained for construction by deflating the current price series by an index of the cost of labor and construction materials. For producers' durables, an index of selling prices was chiefly used, and for farm improvements, use was made of a series on acres of land improved.

In general, the principal sources were the Federal and State censuses of the period, but a wide range of additional materials was used either directly for the estimates or to test the results. Compared with the national product estimates for the late 19th century, the present series might be considered less reliable, because of the greater scarcity of materials at the earlier dates and the lower reliability of the census returns. On the other hand, restriction of scope to the commodity sectors would tend to improve reliability relative to the national product estimates, since the basic sources for the service estimates included in the latter are much less satisfactory than those for commodity output. The estimates for the different commodity producing sectors are believed about equally reliable, except that for construction which is substantially inferior to the others. Also, because of the greater relative importance of construction in the fixed capital series, it is less reliable than the value-added series for all sectors combined.

F 250–261. National income and persons engaged in production, by industry divisions, 1869–1970.

Source: U.S. Bureau of Economic Analysis, *Long Term Economic Growth, 1860–1970*.

National income by industry of origin measures the income accruing to the various factors of production involved in producing each industry's output. This income is the sum of employee compensation, proprietors' income, rental income, corporate profits, and net interest. The national income data used to construct this table are from several sources. One set of data, covering 1869–1937, is from Robert F. Martin, *National Income in the United States, 1799–1938* (National Industrial Conference Board, New York, 1939). Another set, for 1919–1938, is from Simon Kuznets, *National Income and Its Composition, 1919–1938* (National Bureau of Economic Research, New York, 1941). A third set, for 1929–70, is from *The National Income and Product Accounts of the United States, 1929–1965* and the *Survey of Current Business* (U.S. Bureau of Economic Analysis).

The Martin data and the Kuznets data exclude corporate profits taxes and include interest on government debt, while the Commerce data include corporate profits taxes and exclude interest on government debt. Also, undistributed corporate profits are not included in the Martin data but are in the Kuznets and Commerce data.

Persons engaged in production, by industry, measures the number of persons engaged in producing each industry's output. Included are all persons working for wages or salaries and active proprietors of unincorporated enterprises who devote most of their time to the business. The data on persons engaged are from two sources. Data for the early period, 1869–1929, are from John W. Kendrick, *Productivity Trends in the United States* (Princeton University Press, 1961). Data for 1929–1970 are Bureau of Economic Analysis series from *The National Income and Product Accounts of the United States, 1929–1965*, and the *Survey of Current Business*.

F 262–286. Personal income and outlay, 1929–1970.

Source: U.S. Bureau of Economic Analysis, 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965;* 1964–1970, *Survey of Current Business,* July issues, table 2.1.

For definitions of personal income and outlay components, see text for series F 6–9 and F 47–70. Transfer payments to persons consist of income received by persons, generally in monetary form, for which no services are rendered currently. Personal transfer payments to foreigners consist of personal remittances in kind and in cash to abroad, net of such remittances from abroad.

F 287–296. Personal income—percent distribution and per capita income as percent of U.S. total, by regions, 1840–1970.

Source: 1840–1950, Richard A. Easterlin, "Interregional Differences in Per Capita Income, Population, and Total Income, 1840–1950" in *Trends in the American Economy in the Nineteenth Century, Studies in Income and Wealth,* vol. 24, Princeton University Press, 1960, p. 137 (copyright by National Bureau of Economic Research, New York); 1960–1970, U.S. Bureau of Economic Analysis.

For definition of personal income, see text for series F 6–9.

Regional classification. The following regional classification, adopted by Easterlin, is used in this table: *New England*—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut; *Middle Atlantic*—New York, New Jersey, Pennsylvania, Delaware, Maryland, and the District of Columbia; *East North Central*—Ohio, Indiana, Illinois, Michigan, Wisconsin; *West North Central*—Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, Kansas; *South Atlantic*—Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida; *East South Central*—Kentucky, Tennessee, Alabama, Mississippi; *West South Central*—Arkansas, Louisiana, Oklahoma, Texas; *Mountain*—Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada; *Pacific*—Washington, Oregon, California.

Data for 1930–1970 are averages for, respectively, 1927–32, 1937–44, 1948–53, 1957–62, 1963–67, and 1968–71.

F 297–348. Personal income, by States: 1929–1970.

Source: U.S. Bureau of Economic Analysis, 1929, 1940, 1949, and 1956, *Survey of Current Business,* April 1969, tables 3 and 5; 1948, 1950–1955, and 1957–1970, *Survey of Current Business,* August 1973, tables 1 and 2.

See text for series F 262–286.

★★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States,* beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract,* see Appendix I in the *Abstract.*

Series F 210–215. Percent Distribution of Aggregate Payments, by Type of Income, in Current Prices: 1870 to 1968

[Percents based on annual averages for periods shown]

Period	Total	Employee compensation	Entrepreneurial income	Dividends	Interest	Rent
	210	211	212	213	214	215
Based on Dept. of Commerce estimates:						
1959–1968	100.0	75.0	10.9	3.6	3.5	7.0
1954–1963	100.0	74.3	12.4	4.2	3.4	5.7
1949–1958	100.0	73.1	14.5	4.4	3.4	4.6
1944–1953	100.0	71.2	17.5	4.0	3.3	4.0
1939–1948	100.0	69.8	18.9	3.6	3.4	4.3
1934–1943	100.0	67.7	17.7	3.4	4.6	6.6
1929–1938	100.0	64.0	16.0	4.5	5.9	9.6
Based on NBER[1] estimates of aggregate payments:						
1929–1938	100.0	64.9	15.9	6.6	8.4	4.3
1924–1933	100.0	63.1	16.6	6.5	7.8	5.9
1919–1928	100.0	61.7	19.5	5.6	6.1	7.1
1914–1923	100.0	59.2	22.5	5.6	5.6	7.2
1909–1918	100.0	56.2	24.6	6.1	5.4	7.6
Based on Martin's estimates of aggregate payments:[2]						
1909–1918	100.0	59.7	23.3	6.5	4.9	5.7
1904–1913	100.0	59.6	23.3	5.7	5.1	6.3
1899–1908	100.0	59.5	23.8	5.3	5.1	6.4
Based on King's estimates of value of product:						
1900 and 1910	100.0	47.1	28.8	15.9		8.3
1890 and 1900	100.0	50.4	27.3	14.7		7.7
1880 and 1890	100.0	52.5	23.0	16.5		8.2
1870 and 1880	100.0	50.0	26.4	15.8		7.8

Series F 216–225. Percent Distribution of National Income or Aggregate Payments, by Industry, in Current Prices: 1869 to 1968

[Percents based on annual averages for periods shown]

Period	Total	Agriculture	Mining	Manufacturing	Contract construction	Transportation and other public utilities	Trade	Services	Government	Finance and miscellaneous
	216	217	218	219	220	221	222	223	224	225
Based on Dept. of Commerce estimates of national income (adjusted):[1]										
1959–1968	100.0	3.8	1.1	28.4	5.2	7.5	15.2	11.7	15.9	11.2
1954–1963	100.0	4.5	1.5	28.8	5.2	7.8	15.6	10.7	14.9	11.0
1949–1958	100.0	5.9	1.8	29.3	5.3	8.0	16.0	9.7	13.9	10.2
1939–1948	100.0	9.2	1.9	28.0	3.7	8.2	16.4	8.6	15.7	8.4
1934–1943	100.0	9.1	2.1	26.7	3.4	9.2	16.1	9.4	14.4	9.7
1929–1938	100.0	9.3	2.1	22.4	3.2	10.6	16.1	11.1	12.1	13.1
Based on NBER estimates of national income:										
1939–1948	100.0	9.4	1.6	27.1	3.4	7.3	13.3	10.5	17.2	10.2
1934–1943	100.0	9.2	1.7	24.2	2.9	8.5	13.2	12.1	15.4	12.7
1929–1938	100.0	8.5	1.7	19.4	2.9	10.0	13.6	13.9	14.4	15.6
1924–1933	100.0	8.7	1.9	19.6	4.2	10.4	13.3	13.4	11.8	16.7
1919–1928	100.0	10.5	2.5	21.9	4.4	9.8	13.6	11.6	9.6	16.1
Based on Martin's estimates of aggregate payments:										
1919–1928	100.0	12.2	3.1	22.2	3.9	11.3	13.7	9.4	8.6	15.7
1914–1923	100.0	15.2	3.3	22.2	3.0	11.0	14.0	8.3	7.9	15.0
1909–1918	100.0	17.7	3.3	20.8	3.2	10.7	14.5	8.2	6.3	15.4
1904–1913	100.0	17.0	3.3	18.9	4.3	11.0	15.0	8.9	5.4	16.2
1899–1908	100.0	16.7	3.1	18.4	4.5	10.7	15.3	9.6	5.6	16.0
1889 and 1899	100.0	17.1	2.5	18.2	4.9	10.7	16.8	11.8	6.0	12.0
1879 and 1889	100.0	16.1	2.1	16.6	5.5	11.9	16.6	13.6	4.9	12.6
1869 and 1879	100.0	20.5	1.8	13.9	5.3	11.9	15.7	14.7	4.4	11.7

Chapter F

National Wealth and Saving (Series F 349-667)

F 349–469. General note.

The national balance sheet is derived by summing similar balance sheets for sectors in the economy—nonfarm households, agriculture, unincorporated business, corporations, etc. The balance sheet of each group is in turn derived by summing the balance sheets of the constituent units, based as far as possible on a comparable valuation of assets and liabilities. In deriving the balance sheet, no creditor-debtor or owner-issuer relationships among units are eliminated; for example, the debts of households to corporations appear on one side as assets of corporations and on the other as liabilities of households. When all relationships among constituent units are canceled, whether these units be in the same or different groups, the balance sheet reduces to a national wealth statement. (In the series shown, the estimate for total tangible assets in the national balance sheet differs very slightly from that in the statements of national wealth and national tangible assets because of a minor disparity in the treatment of monetary metals.) Thus, the national balance sheet adds to the national wealth statement a comprehensive summary of the various types of financial obligations outstanding at a particular date, and provides perspective on the magnitude of financing activities in the Nation's economy.

The national balance sheet falls somewhat short of the goal of a comprehensive summary of the assets, liabilities, and net worth of all transactors in the economy, since, for lack of data, obligations among households are not included, and in the case of corporations with subsidiaries, the balance sheet of the parent company is used, thus eliminating relationships among the subsidiary units. In addition, intangibles such as goodwill and patent rights are excluded from the balance sheet. Finally, and this limits the comprehensiveness of the national wealth statement as well, inventories of nondurable goods in the hands of consumers, expenditures on soil improvement, subsoil assets, and military and naval equipment held by the government are omitted.

The value for "equity" in the national balance sheet exceeds total national wealth, that is, consolidated net national worth. This is primarily because, in the balance sheet, the net worth of the various constituent units are added together. For example, the net worth of a corporation is added to the net worth of the stockholders. In the national wealth statement, however, they are consolidated. That is, the outstanding stock of the corporation is canceled against the holdings of the owners, leaving only the net worth of the stockholders and the undistributed earnings of the corporations. Stated differently, the "equity" entry in the balance sheet includes the equity of intermediaries as well as of ultimate owners.

F 349–364. National tangible assets, in current prices, 1952–1968.

Source: U.S. Congress, *Institutional Investor Study Report of the Securities and Exchange Commission, Supplementary Volume I*, House Document 92–64, Part 6, March 10, 1971.

Estimates of reproducible assets shown in series F 349–364 and F 365–376 were made using the perpetual inventory method. This method involves the computation of a weighted sum of a time series of gross investments in the asset; the weights are determined by the particular life and depreciation assumptions employed in the calculation. The difference between the gross investment of a given year and the change in stock during that year is, by definition, the depreciation which has occurred. To derive the replacement cost estimates used in series F 349–364, the calculation was first made in terms of constant dollars (series F 365–376), and then the stock and depreciation estimates were reflated to current year prices.

The gross investment series used for the estimates of the private stock of depreciable assets are in all cases those used in the gross investment component of the income and product accounts produced by the U.S. Bureau of Economic Analysis (BEA). For public sector estimates, the construction data and equipment series were taken from the income and product accounts wherever possible. Such data are published regularly in the *Survey of Current Business*, although the two government sectors are not credited with capital formation in the BEA accounts.

For a detailed description of the method used to obtain estimates for the various components of depreciable assets, see the source publication cited above, pp. 252–259.

Land estimates shown in series F 349–364 and F 365–376, with few exceptions, are those given in Appendix II, "Estimates of the Value of Land in the United States Held by Various Sectors of the Economy, Annually, 1952 to 1968," of the source publication. The land of financial corporations was estimated by multiplying the Internal Revenue Service estimates of the book value of land of all financial institutions by the market-to-book ratio developed in Appendix II for "finance, insurance, and real estate." No adjustment was made for unincorporated financial institutions, which tend to be brokerage houses, as the land holdings of the finance, insurance, and real estate aggregate for partnerships and proprietorships are accounted for primarily by the holdings of real estate firms.

The estimated value of farmland shown in these series was derived by subtracting the value of buildings from the U.S. Department of Agriculture's estimate of the value of farm real estate.

Transactions were measured by first differences in the holdings.

F 365–376. National reproducible tangible assets in constant (1958) prices, 1952–1968.

F 377–421. National balance sheet, in current prices, 1900–1968.

Source: Raymond W. Goldsmith, et al., *Studies in the National Balance Sheet of the United States*, vol. II, Princeton University Press, tables I and Ia (copyright 1963 by National Bureau of Economic Research, New York); and unpublished data.

The national balance sheet is derived by summing similar balance sheets for various transactor groups in the economy—nonfarm households, agriculture, unincorporated business, etc. (see general note for series F 349–469). For most of these groups, however, balance sheets of the constituent units are nonexistent, so that in practice the group balance sheet is compiled from separate estimates of the various categories of assets and liabilities, net worth being derived as a residual. Only in the case of corporations and the Federal Government does a substantial proportion of the items come from their own financial statements. Military assets, i.e., military structures and equipment and the assets of the Atomic Energy Commission, are excluded from these balance sheets.

The estimates presented are in current prices rather than original cost. Essentially, this means that reproducible tangible assets are valued at reproduction cost, and nonreproducible tangible assets and intangibles at market value, though some intangibles, particularly short-term claims, are valued at par or face value.

In deriving the estimates, a problem sometimes arose because of a difference between two groups in the value at which the same item is carried on the balance sheet, a difference not attributable to bad debt

reserves alone. Where this was the case, no attempt was made to force consistency. Both valuations were carried over into the national balance sheet on the appropriate sides. This, together with the treatment of net holdings of foreign assets and liabilities, principally accounts for differences between the asset and liability totals for certain intangible items—differences which are generally small compared with the balance sheet totals.

The source provides considerable additional detail—in particular, balance sheets for separate transactor groups, such as nonfarm households, agriculture, etc., and makes it possible to trace the patterns of claims and counterclaims among the various groups.

Figures for 1958–1968 have been derived principally from the Federal Reserve Board's flow-of-funds data and differ from earlier data mainly because of statistical revisions in the basic data. However, differences in the following items are the result of conceptual differences.

F 381, monetary metals. Data for 1900–1958 include all gold and silver coin; data for 1958–1968 include gold and official foreign exchange reserves.

F 382, other currency and demand deposits. The earlier estimates include cash items in process of collection and other interbank claims within the private financial sector which are not included in the flow-of-funds data. These items amounted to $35.1 billion in 1958.

F 397, U.S. Government securities, long-term. Data for 1900–1958 include special issues held by U.S. Government pension and trust funds; data for 1958–1968 do not. Data for 1958–1968 include issues of U.S. Government credit agencies, while 1900–1958 estimates include these in "other bonds and notes" below.

F 401, other bonds and notes. See above.

F 405, equity in other business. Data for 1900–1958 include equity in unincorporated broker-dealers; 1958–1968 data cover non-farm, nonfinancial business only.

F 410, private life insurance reserves. The 1900–1958 data include the pension reserves of life insurance companies and the policy reserves of fraternal insurance organizations which are not included in the flow-of-funds figures. However, the policy reserve estimates are available in Appendix I of the *Institutional Investor Study* (see source for series F 349–364).

F 411, private pension and retirement funds. Data for 1958–1968 include the pension reserves of life insurance companies which are included in F 410 for 1900–1958.

F 412, Government pension and insurance funds. Data for 1900–1958 include the reserves of Old Age Survivors Insurance, about $21.9 billion in 1958; data for 1958–1968 omit these, although data are available in the *Monthly Treasury Statement.*

F 422–445. National wealth, by type of asset, in current prices, 1850–1958.

Source: Raymond W. Goldsmith, 1850–1900, "The Growth of Reproducible Wealth of the United States of America From 1805 to 1950," International Association for Research in Income and Wealth, *Income and Wealth of the United States: Trends and Structure,* Income and Wealth Series II, Bowes and Bowes, Cambridge, England, 1952, p. 306 (estimates for 1805 presented in this publication have not been reproduced here because of questionable reliability); 1900–1958, *The National Wealth of the United States in the Postwar Period,* Princeton University Press, App. A and B (copyright 1962 by National Bureau of Economic Research, New York).

The estimates for 1900 to 1958 were constructed by Goldsmith by means of the "perpetual inventory method." In this method, the stock of an asset in existence at a given point in time is estimated from annual output totals extending back over a period equal to the average life of the asset, the output total for every year being depreciated to the end of the period, and the results summed. (See also text for series F 349–364.) Military assets are excluded.

The underlying estimates for 1850 appear in the Census Office, *Preliminary Report of the Eighth Census,* 1862, p. 195; and those for 1880, 1890, and 1900 in Simon Kuznets, *National Product Since 1869,* National Bureau of Economic Research, New York, 1946, pp. 202–215. In every case, the original estimates were adjusted by Goldsmith (for 1880 substantially) to improve comparability with the estimates for 1900–1958. The basic sources for these earlier estimates were returns on stocks of various assets in the industrial censuses and censuses of wealth. Hence, there is a sharp break in the method of derivation between the earlier and later estimates. However, the figures for the overlap year, 1900, agree reasonably well. The figures for 1850 exclude the value of slaves.

The estimates for 1900–1958 are in "current prices," that is, each asset is valued at its replacement cost in the given year. This is preferable to valuation at original cost, whether depreciated or undepreciated. Assets appearing in the wealth statement for any given date were produced in different years, and since prices change from year to year, summation of original cost values would often result in an arithmetic aggregate without economic meaning.

For the estimates for 1850 to 1900, which are primarily from the Federal censuses, the basis of valuation is not always certain, and is not uniform among types of assets and among industries. It is possible that the figures may approximate either current market values or original cost, depreciated or undepreciated, or some combination of the two. Some assurance as to the comparability of the earlier and later sets of figures on this score is provided, however, by the overlapping values for 1900, though this comparison applies only to a single year.

As to the reliability of the estimates for 1850 to 1900, the source (*Income and Wealth of the United States: Trends and Structure*) states that the margin of error amounts to hardly less than 10 to 20 percent at any date, that this relative margin increases going back in time, and that it is not certain that comparability is impaired by as much as the size of the margin may imply because the error probably tends in the same direction for most if not all benchmarks, although the understatement is probably more pronounced in the early part of the period than in the latter. Concerning the estimates for 1900 to 1958, derived by the perpetual inventory method, the most important source of error is considered to reside in the estimates of construction expenditures. For some of the components of total wealth, reliability is strengthened because of the availability of checks against alternative estimates, as is the case for residential real estate, farm structures, inventories, and international assets. Checks are less satisfactory for nonfarm business structures and equipment but the information in corporate balance sheets submitted to the Internal Revenue Service gives assurance that the perpetual inventory estimates are not too far off for recent years. The only sectors of reproducible tangible wealth in which the perpetual inventory estimates are not subject to checks, or only to very unsatisfactory checks are consumers' durables and government fixed assets.

The source also presents considerably greater detail than given here (for example, annual estimates for 1896–1949). Estimates of national wealth by contemporaries are also available for various dates during the 19th century. See, for example, Samuel Blodget, Jr., *Economica; A Statistical Manual for the United States,* 1806 edition, and *Annual Report of the Director of the Mint, 1881.*

F 446–469. National wealth, by type of asset, in 1929 and 1947–49 prices, 1850–1958.

Source: See source for series F 422–445.

These estimates were derived by adjusting the current dollar figures for a given class of assets in series F 422–445 for the change in price or cost of construction of that type of asset between each year and the base year. Thus, conceptually, changes over time in the constant price value of a category of assets reflect changes in the physical stock of that asset and not in its value. For 1945–1958, a different base year was necessary because estimates in 1929 prices for the most recent years were not available. This shift in base years introduces some element of incomparability, since the relative weights of individual assets in the price index differ between the two years.

For 1900–1958, an attempt was made to adjust for price changes by fairly narrow classes of assets, using construction cost or price indexes referring specifically to the assets in each class. For 1880, 1890, and 1900, a more summary adjustment was used. Only three separate deflators were employed for construction (residential, other private, and farm), and a single deflator was used for all types of equipment. For 1850, the same price index (Snyder's index of the general price level) was applied to all types of structures and equipment, although for the adjustment of inventories the wholesale price index was used.

Goldsmith states that the conceptual significance of a constant price estimate for land is open to question. If land is carried for all dates at its absolute value in the base year, the relation to the constant price value of reproducible assets tends to become unrealistic, particularly at dates fairly far removed from the base year. In the present estimate, an alternative procedure is followed, a constant price value of land being derived, generally speaking, as a fixed proportion of the constant price value of structures. This permits derivation of a constant price series for aggregate national wealth, but it should be recognized that the deflated estimates of land values included in the totals cannot be conceived as reflecting changes in physical units alone.

The adjustment for price changes introduces errors in the estimates in addition to those discussed in connection with series F 422–445. On balance, any error is likely to lead towards an overstatement of the price rise over the period and hence an understatement of growth rates because the techniques used in adjusting for price change fail to make adequate allowance for improvement in the quality of the assets, and there is no evidence that the error is larger for one part of the period than for another, although the possibilities of error are certainly greater in the 19th century than the 20th. In addition, it is likely that the failure to allow for quality improvement has a differential effect on the different components of wealth. In particular, it leads to a more serious understatement in the growth of components such as producer and consumer durables than for structures and inventories.

F 470–534. General note.

Although estimates of capital stocks are less well developed than those of economic flows, in recent years a number of capital stock estimates have been prepared and published by the U.S. Bureau of Economic Analysis (formerly the U.S. Office of Business Economics), as part of a project to measure the entire tangible wealth of the Nation. BEA estimates have been published for (1) residential capital, (2) fixed nonresidential business capital, (3) provisional estimates of consumer durable goods, and (4) stocks of business inventories. References for these studies are as follows: (1) John C. Musgrave, "New Estimates of Residential Capital in the United States, 1925–73," *Survey of Current Business*, October 1974; (2) Bureau of Economic Analysis, *Fixed Nonresidential Business Capital in the United States, 1925–73*, 1974; (3) Henry Shavell, "The Stocks of Durable Goods in the Hands of Consumers, 1946–1969," *1970 Proceedings of the Business and Economics Section of the American Statistical Association*, 1971; (4) Shirley F. Loftus, "Stocks of Business Inventories in the United States, 1928–71," *Survey of Current Business*, December 1972, with updating in August 1974 *Survey of Current Business*. Also, estimates of inventories owned by nonfinancial corporations, as of midyear for the years 1948–71, in constant (1958) prices and the current prices of each year, appeared in "Nonfinancial Corporations: New Measures of Output and Input," by John A. Gorman, *Survey of Current Business*, March 1972.

Series F 470–479, F 480–515, F 516–527, and F 528–534 provide selected series from these BEA capital stock studies. Series F 470–479 is a summary table providing series on gross and net stocks of nonresidential structures and equipment, residential structures and equipment, and inventories in both current and constant prices. Greater detail on nonresidential structures and equipment and residential structures is provided in series F 480–515, F 516–527, and F 528–534.

Fixed nonresidential structures and equipment estimates are computed by the perpetual inventory method, which derives capital stock estimates for a given year by cumulating past investment and deducting the cumulated value of the investment that is used up. The data used to implement this method are taken from the national income and product accounts since 1929 and from various private studies prior to that time. Included are all privately owned nonresidential structures and producers' durable equipment. Estimates shown are on the secondhand price method of valuing business purchases of government surplus assets, variant 1 deflators for structures, straight-line depreciation, and 85 percent of service lives given in Bulletin F, Internal Revenue Service. The series published here is just one of a number of variants of capital stock estimates reflecting different valuations, service lives, and depreciation techniques. (See source for additional estimates.)

The residential capital estimates are also computed by the perpetual inventory method. The data used to implement this method are taken from the national income and product accounts since 1929 and from various private studies prior to that time. Included are all residential structures, both privately and publicly owned. Depreciation is estimated by a declining balance formula.

The stocks of business inventories shown in series F 470–479 were calculated by cumulating the annual inventory changes, in book values and in constant (1958) prices, respectively, that are estimated in the national income and product account. An estimate of the level of each book value and constant price stock series was made for some single point in time for which appropriate data were available; that stock was then moved forward through time by adding the estimated annual changes and backward through time by substracting the annual changes.

Series F 516–527 and F 528–534 give information on the age structure of the capital stock. Such information is essential for gauging the extent to which capital is up-to-date in terms of both physical condition and technological characteristics. Two measures of age structure are presented in the publications cited above: an average age series of the capital stock and the ratios of the net stock of the capital to the gross.

These two measures of age can be used interchangeably for many purposes, but each provides specific information. The net-gross ratios show the extent to which the services initially embodied in capital goods remains intact, on the assumption that the purchase price is a measure of the value of the services bought initially and that depreciation reflects the value of the services that have been used up. The average age measures, which are given in series F 516–527 and F 534, provide information on absolute age.

F 535–539. Value of stock of structures and equipment in specified sectors, in 1929 prices, 1880–1948.

Source: Simon Kuznets, *Capital in the American Economy: Its Formation and Financing*, National Bureau of Economic Research, New York, 1961 (copyright).

These estimates fall somewhat short of the value of all reproducible wealth in each sector, since the value of inventories is omitted, and considerably short of total wealth, since land is excluded. Also, data are not available for other business sectors; for example, trade and the service industries are omitted. However, it is estimated that the four sectors included here accounted for about 80 percent of the stock of structures and equipment in 1880.

The underlying sources of the estimates are three monographs prepared in connection with the National Bureau of Economic Research Study of Capital Formation and Financing: Alvin S. Tostlebe, *Capital in Agriculture: Its Formation and Financing Since 1870*, Princeton University Press, 1957; Daniel Creamer, Israel Borenstein, and Sergei P. Dobrovolsky, *Capital Formation and Financing in Manufacturing and Mining, 1960*; and Melville J. Ulmer, *Capital in Transportation, Communication, and Public Utilities: Its Formation and Financing, 1960*. With the exception of the last monograph, the approach followed in deriving the estimates of capital stock differed rather noticeably from that chiefly employed in obtaining the figures presented in series F 422–469, since the basic data, such as census returns on capital or balance sheet items in *Statistics of Income*, related to stocks rather than output flows. Further detail on capital investment by type and/or minor industrial sector is given in these monographs.

F 540–667. General note.

Statistics of saving provide the link between the statements of national income or product, on the one hand, and the national wealth statement and balance sheet, on the other. Generally speaking, for the Nation as a whole, aggregate saving, which equals national income less national consumption, is identical with net national investment, and the latter, in turn, is equal to the change in real national wealth. For the individual economic unit, however, saving is equal not to the change in holdings of real assets, but to the difference between the change in total assets (both tangible and intangible) and total liabilities. The national balance sheet registers the effect of saving on the stock of intangibles as well as tangibles.

The link provided by the saving statistics is imperfect for both conceptual and statistical reasons. To note only some of the principal conceptual differences, there are, first, variations in the treatment of government. In the Department of Commerce estimates of income and saving, government investment and government saving are excluded, while in the Kuznets income estimates, and the Goldsmith saving and wealth estimates, government saving and investment are included, though the Goldsmith estimates exclude military assets. Another important difference is in the treatment of consumer durables, which in both the Department of Commerce and Kuznets income estimates is not considered investment, but in the Goldsmith estimates of saving and wealth is so considered. Finally, there are important differences in the scope and valuation of capital consumption allowances. Beyond the conceptual differences, there are variations in the sources and techniques employed by the different estimators. The broad outlines of the relationships among the different social accounts can, nevertheless, be distinguished. In addition, the saving statistics throw important light on the nature of the different groups of savers in the economy and the forms that saving takes.

F 540–551. National saving, by major saver groups, in current prices, 1897–1945.

Source: Raymond W. Goldsmith, *A Study of Saving in the United States*, vol. I, 1955, p. 345 (saving, excluding consumer durables, computed by subtraction of estimates of saving in consumer durables for nonagricultural individuals, p. 359, and for agriculture, p. 756). Reprinted by permission of Princeton University Press.

These series provide an estimate of saving by government (thus permitting the derivation of aggregate national saving), and estimates of personal saving subdivided among three major groups—nonagricultural individuals (including private nonprofit institutions and personal trust funds), agriculture, and unincorporated business.

The saving concept underlying these estimates differs somewhat from the concept represented by series F 552–565. While these estimates include all forms of saving covered in series F 552–565, they also cover saving in the form of consumer durables, and of brokers' and dealers' commissions and profits on change of hands of existing assets. In addition, in deriving these estimates of net saving, capital consumption allowances have been valued at replacement cost. Neither set of figures, however, includes saving in the form of soil improvement or additions to military assets. An important difference also exists between the two sets of estimates in the technique of derivation. The estimates in series F 552–565 were derived by the income approach; these figures, with the exception of those for corporate saving, were obtained by the balance sheet method. In this respect, they are similar to the estimates of personal saving presented in series F 638–667, though differences in techniques and in concept cause the actual estimates to differ between the two tables, e.g. because of inclusion in series F 659 (but not in series F 623) of stock issues of small corporations not distributed by security dealers.

The following statement from the source (pp. 40–41) provides an indication of the reliability of the estimates:

> Evaluation of the possible errors in the individual series from which the estimates of group and national saving have been constructed indicates that the margin of error is hardly under 10 percent for any given year or for the average annual figure in any series, that it is probably in the order of magnitude of 20 to 30 percent in many of them, that it may run even higher in not a few cases, but that the relative margin of error in most cases is reduced for sequences of several years and generally the smaller the longer the period . . .
>
> Most of the components utilized in building the estimates of saving of any of the major saver groups are statistically independent; and the estimates for the major saver groups are very largely independent of each other except for those on nonfarm households and unincorporated business enterprises. Accordingly since the number of components of saving is large for each of the groups, running to several dozen even if only those of substantial quantitative importance are taken into account, there is reason to assume that errors in one direction, i.e. overstatements or underestimates of saving, made in any one year in some of the component series will be offset by errors in the opposite direction in other series. As a result, the relative error in the estimates of saving by the major groups, and still more the estimates of broad aggregates such as national or personal saving, may be expected to be considerably lower than the average of the relative errors in the component series. Indeed, it is quite possible that, if we take account of the number of independent component series and their relative size, and even take a pessimistic view of errors in constituent series, the relative error of national or personal saving in any one year does not on the average exceed something like 10 percent.
>
> The quality of most of the individual series used in the measurement of saving has undoubtedly improved. It would seem to be substantially poorer for the period before the thirties than for the last two decades, and within the earlier period, in turn, to be particularly poor for the years before approximately 1905. Nevertheless, there is no statistical evidence, such as might be provided by the difference between estimates of saving and investment, that the estimates of aggregate saving have larger relative errors in the earlier part of the period than in the later part. Indeed, from that point of view, the relative error in the estimates would have to be regarded as substantially the same through the thirties, and as considerably lower only for the last decade. There is, however, evidence . . . that the error is . . . in the direction of an overstatement of saving in the first three decades and an understatement during the thirties.

F 552–565. Sources and uses of gross saving, 1929–1970.

Source: U.S. Bureau of Economic Analysis, 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965;* 1964–1967, *U.S. National Income and Product Accounts, 1964–67;* and 1968–1970, *Survey of Current Business*, July issues, table 5.1.

The following are definitions used by the source:

Gross private saving is the total of household and business saving. Saving through government, including government insurance funds, is excluded. Household expenditures for consumer durables, except on residential construction, are not treated as saving. The series is "gross" in that it includes business capital consumption allowances and depreciation on residences.

Personal saving represents the excess of personal income over the sum of personal consumption expenditures and personal tax and nontax payments. It includes the current saving of individuals (including owners of unincorporated business), nonprofit institutions, and private health, welfare, and trust funds. Personal saving may be in such forms as changes in cash and deposits, security holdings, indebtedness, and reserves of life insurance companies and mutual savings institutions, the net investment of unincorporated enterprises, and the acquisition of real property net of depreciation. Inventory profits and other capital gains are excluded.

Gross business saving includes undistributed corporate profits, corporate inventory valuation adjustment and capital consumption allowances, and, for 1943–1953, the excess of wage accruals over disbursements.

Undistributed corporate profits represent the difference between corporate profits after taxes and dividends. Corporate profits after taxes are the earnings of corporations organized for profit which accrue to the residents of the Nation, measured after Federal and State profit taxes, without deduction of depletion charges and exclusive of capital gains and losses. Dividends measure cash dividend disbursements by corporations organized for profit to stockholders who are residents of the United States.

Corporate inventory valuation adjustment is the excess of the value of the change in the volume of nonfarm corporate business inventories, valued at average prices during the period, over the change in the book value of nonfarm corporate inventories.

Capital consumption allowances represent the sum of business depreciation charges and accidental damage to fixed business capital. Business depreciation charges are charges made by private business against receipts for the current consumption of durable capital goods and comparable allowances for nonprofit institutions. They include depreciation charges against owner-occupied houses. Depreciation reported by business is not adjusted for changes in the replacement value of capital goods, except for farm enterprises. Accidental damage to fixed business capital represents the value of the physical losses by fire, natural events, and other accidents to fixed capital of private business not covered by depreciation charges.

Government surplus or deficit is the excess of government receipts over government expenditures as defined in the national income and product accounts. As such, it equals the acquisition of financial assets less borrowing by general government and government enterprises. It also includes new government purchases of land. Net acquisitions of reproducible assets are excluded here because they are included in government purchases of goods and services.

Capital grants received by the United States in 1970 are the Special Drawing Rights allocated to the United States by the International Monetary Fund. These allocations represent additions to the foreign assets of the United States that are not matched by corresponding liabilities. They are considered part of the U.S. net foreign investment and are shown as a source by means of this special entry.

Gross private domestic investment consists of the net acquisitions of fixed capital goods by private business and nonprofit institutions; including commissions arising in the sale and purchase of new and existing fixed assets, principally real estate; and the value of the change in the volume of inventories held by business. It covers all private dwellings including those acquired by persons for their own occupancy.

Net foreign investment is numerically equal to the balance on goods, services, and unilateral transfers as measured in the balance of payments statistics. As such, it is equal to the acquisition of foreign assets by U.S. residents less the acquisition of U.S. assets by foreign residents. It also includes the "errors and omissions" item in the balance of payments statistics.

With respect to reliability of these estimates, the Department of Commerce notes that the margin of error in the estimates of gross private saving and its components tends generally to be high. Because personal saving is derived as the difference between two much larger totals, it is subject to large percentage error in both level and movement. Undistributed corporate profits is more accurate, but the corporate inventory valuation adjustment is liable to considerable error, so that the reliability of the two items combined is not high. Furthermore, while approximately half of the estimate for capital consumption allowances is based on fairly solid data, the remainder is estimated on the basis of a variety of sources and methods, and some of these are subject to a wide margin of error.

Series F 566–594. Individuals' saving, by components, in current prices, 1946–1970.

Source: Board of Governors of the Federal Reserve System, *Flow of Funds Accounts: Annual Flows, 1946–1971*, August 1972, pp. 69–71.

Series F 566–594 presents an estimate of personal saving that is conceptually equivalent to the amounts derived in national income accounts (NIA), series F 553, but statistically it is almost entirely independent of NIA data. The NIA series for personal saving is calculated as a residual in current transactions: Personal income less personal taxes less consumption and other current outlays. That residual measures the net flow of funds from current activities of persons and is used for acquisition of capital assets, both tangible and financial, and for repayment of personal debt. Series F 566–594 is a direct measure of those capital acquisitions and debt flows and is thus an estimate of the same net flow of personal saving in terms of the capital uses to which it is put. The basic identity relationship reflected in series F 566–594 is that personal saving equals net acquisition of capital assets less net increase in debt, or alternatively that total sources of funds from saving and net borrowing equals total uses of funds for capital asset purchases.

Series F 566–594 divides these capital account transactions into three sections: Net increase in financial assets, net investment in tangible assets, and increase in debt owed by individuals. Financial assets consist of claims on others (including other individuals), mainly in the form of money, deposits, securities, corporate equities, and equities in insurance and pension reserves. The amounts shown are net transaction flows, the excess of acquisitions over liquidations; and changes in values of holdings through market price movements. Unrealized capital gains are not included in the figures.

Investment in tangible assets (series F 583) appears net of capital consumption allowances, which are mainly book depreciation charges. These charges are reflected in personal consumption in NIA and personal saving is thus smaller because of them. Increases in personal debt, in the third section, are offsets to asset acquisitions. Funds acquired from borrowing are used either for the asset purchases shown in the table or for consumption or tax payments, both of which decrease saving.

The table on p. 251 compares this capital-account calculation of net investment—which is equal to saving—with the NIA estimate.

The capital account version differs in a few conceptual aspects from the NIA definition, and adjustments are made for these differences. The adjustments allow for equities in government life insurance and retirement fund reserves, which are included in assets in this table but not in NIA personal saving; investment in consumer durables, which are treated as capital goods in this table but as current consumption in NIA; and investment company capital gains dividends,

Table 1. Relation Between Individuals' Saving and Personal Saving in the National Income Accounts

[In millions of dollars]

Item	1966–1970, average	1961–1965, average	1956–1960, average	1951–1955, average	1946–1950, average
Individuals' saving	61,839	41,073	32,555	29,606	23,243
Less—					
Government insurance and pension reserves	6,368	3,950	2,696	1,784	1,703
Net investment in consumer durables	13,631	8,894	4,387	6,052	7,537
Capital gains, dividends from investment companies	1,785	594	347	119	40
Net saving from farm corporations	−5	−44	−27	−19	45
Equals—					
Personal saving, flow of funds basis	40,060	27,679	25,152	21,669	13,918
Personal saving, national income accounts	40,921	23,461	19,943	17,196	11,682
Statistical difference	−862	4,218	5,208	4,473	2,236

which are excluded from NIA personal income but are reflected in either current or capital outlays of individuals receiving the dividends. The allowance for retained earnings of farm corporations is needed because their asset and liability transactions are unavoidably included in the earlier parts of the table. With these adjustments the net total for saving is conceptually equal to the NIA estimate, and as a statistically independent measure is compared with the NIA series at the end of the table. For most years the estimates of asset acquisitions less borrowing are several billion dollars higher than the NIA residual estimate of saving. One probable source for these differences is net sales of land and existing real estate by individuals to corporations and government. No data are available to estimate land transactions, but if in fact there are net sales they should be included as a negative investment among tangible assets. Beyond the land item, sources of the statistical discrepancy are not known, and the errors and omissions that it reflects cannot be distributed on any basis between the NIA and capital account estimates.

The data in series F 566–594 are from the Federal Reserve's flow of funds accounts which appear in broader form in Chapter X.

Series F 566–594 is a consolidation of capital accounts for households, personal trust funds, nonprofit organizations, farms, and nonfarm noncorporate business. In Chapter X, the farm and nonfarm business components are included with corporate business in a statement for all business together, while the nonbusiness components here appear there as a household group. In the consolidation, flows of proprietors' equity funds to business activity have been eliminated.

F 595–637. Individuals' saving, by components, in current prices, 1929–1962.

Source: 1929–1932, Irwin Friend and Vito Natrella, *Individuals' Saving*, John Wiley & Sons, New York, 1954, pp. 85 and 91 (copyright) (except series F 627 for 1929–1932, see source for series F 540–551, p. 354); 1933–1962, U.S. Securities and Exchange Commission, unpublished data.

Conceptually, individual saving in series F 595 is identical with personal saving in series F 553. However, the total is derived in an entirely different way. In the procedure followed in obtaining series F 595, referred to as the direct or balance sheet method of estimating saving, the total is derived by summing the changes in the various assets and liabilities of the economic units included in the personal sector. Since the reliability of the underlying components varies widely, it is not possible to state unequivocally that the total in series F 595 is subject to a smaller margin of error than that in series F 553. Rather, the two series should be viewed as providing a reciprocal check, with the present series also presenting detail on the various types of saving. While the difference between the two series is substantial for a few dates, they are generally in fair agreement with regard to absolute amount.

The estimates for saving in the form of currency and deposits (including deposits in savings and loan associations) have a relatively small margin of error, while those for saving in the form of corporate and State and local securities probably have a greater margin of error. Generally speaking, the estimates for the earlier years, particularly 1929–1932, are subject to greater error than those for the later years. For a discussion of the limitations of the estimates for a number of the components, see the source (Friend and Natrella).

[1] Estimates derived by "perpetual inventory" method which is intended to reflect reproduction cost of different types of assets. Estimates are obtained by: (*a*) reducing each year's gross capital expenditures in current prices to 1958 price level by means of appropriate construction cost or wholesale price indexes; (*b*) depreciating gross capital expenditures in accordance with an assumed length of life for different types of assets, thus obtaining net capital expenditures for each year in 1958 prices; (*c*) cumulating net capital expenditures for as many years backwards as corresponds to the assumed length of life of the type of asset involved.
[2] Estimates reflect book values reduced by means of wholesale price indexes.

Z Less than $50 million.

[1] Comparable with later years. The relatively small differences between the two series of data given for 1945 are due primarily to use of more recent data for the series comparable with later years and to different methods of estimation; there are no conceptual differences.

[2] Comparable with earlier years.

* Denotes first year for which figures include Alaska and Hawaii.
Z Less than $5 million. [1] Noncorporate.
[2] Includes farm dwellings. [3] Includes accidental damage to fixed property.
[4] Includes changes in assets of noncorporate enterprises of the types specified. Excludes changes in government insurance and pension reserves, and small amounts of Armed Forces leave bonds.
[5] Includes shares and deposits in credit unions and the Postal Saving System.
[6] Includes increases in redemption value of outstanding bonds.

Chapter F

Input-Output Structure of the U.S. Economy (Series F 668-723)

F 668–723. General Note.

This section of chapter F presents input-output tables for the United States which portray the interindustry structure of the economy for five selected post World War II years: 1947, 1958, 1961, 1963, and 1967. The input-output tables show the dollar value of transactions that took place among producing industries and between producing industries and the final markets of the economy.

Periodic preparation of national input-output tables was begun by the Bureau of Economic Analysis (formerly Office of Business Economics) in the late 1950's with the development of a table for 1958. The program was undertaken in response to a recommendation of the National Accounts Review Committee that input-output accounts be prepared regularly as an important and integral component of the national accounts. The findings of this committee, set up at the request of the Bureau of the Budget to evaluate the national accounts work, were published in *The National Economic Accounts of the United States*, Hearings before the Subcommittee on Economic Statistics of the Joint Economic Committee, U.S. Congress, 1957.

Benchmark input-output tables fully integrated into the national accounts have been prepared for 1958, 1963, and 1967; updated tables for the years between benchmarks were made for 1961 and for 1966 (the latter of which is not included in this volume). In addition, the input-output table for 1947, prepared by the Bureau of Labor Statistics in the early 1950's, has been reworked to reflect the concepts and conventions of the current series of I-O tables and to make the data conform to the national accounts. The set of historical input-output tables presented in series F 668–723, are substantially comparable and can be used to observe structural and other changes in interindustry relationships which occur over time. The development of the input-output tool of economic analysis and the actual construction of the first input-output tables for the United States were the work of Wassily W. Leontief. Professor Leontief constructed such tables for 1919, 1929, and 1939. These tables appear in his book, *The Structure of American Economy: 1919-1939*, Oxford University Press, 1951. The tables, however, were not integrated with the national income and product accounts and it has not been possible to rework them into a format directly comparable with the later set of tables.

The relationship between the national income and product accounts, discussed at the beginning of chapter F, and the input-output flow tables presented in this section, are illustrated in the three tables below. The national income and product account is presented in table I. The output of the Nation is shown both in terms of final product flows and in terms of the income types generated in its production. The final product flows appear in the right-hand column of table I. They consist of sales to consumers (personal consumption expenditures), sales to business on capital account and change in business inventories (gross private domestic investment), sales to government (government purchases of goods and services), and net sales to foreigners (net exports). The sum of these final product flows equals the gross national product (GNP). This same total can be derived also by summing the income types (referred to in these series as value added) shown in the left-hand column. The first five items are factor payments that make up national income; the remaining items are nonfactor charges that are added to arrive at GNP.

Table I. The Gross National Product, National Income and Product Account

Types of income	Final product flows
Factor payments: 1. Compensation of employees 2. Proprietors' income 3. Rental income of persons 4. Corporate profits and inventory valuation adjustment 5. Net interest Nonfactor charges: 6. Business transfer payments 7. Indirect business tax and nontax liability 8. Less: Subsidies less current surplus of government enterprises 9. Capital consumption allowances	10. Personal consumption expenditures 11. Gross private domestic investment 12. Net export of goods and services 13. Government purchases of goods and services

Table II displays the same components of GNP as shown in table I, but they are rearranged in an input-output format—a matrix or table containing data arranged in rows and columns. The row labeled "producers" shows the sales of these producers to the same final markets which appear in the right-hand column of table I. The column headed "producers" enumerates the income types which make up GNP—grouped here as payments to employees, to owners of business and capital, and to government. The column sum, like the row sum, equals GNP.

Table II. The Gross National Product In Input-Output Format

	Producers	Persons	Investors	Foreigners	Government	
Producers		Personal consumption expenditures item 10	Gross private domestic investment item 11	Net exports of goods and services item 12	Government purchases of goods and services item 13	Gross national product
Employees	Employee compensation, item 1					
Owners of business and capital	Profit-type income and capital consumption allowances, items 2, 3, 4, 5, 6, 9					
Government	Indirect business taxes and current surplus of government enterprises, etc., items 7 and 8					
	Gross national product					

The shaded box, which represents sales by producers to other producers of the goods and services used in production, is blank in table II. These producer-to-producer sales are already included in the value of the final products that add up to the total GNP. Accordingly, they are omitted to avoid duplication.

For input-output analysis, however, these sales by producers to producers must be measured separately, because this analysis focuses on the way the industries of the Nation interact with each other in producing their output and contributing to GNP. These sales are revealed in table III, which provides an elaboration of the producers portion of table II. Again, sales by producers to final markets are shown, as well as income payments by producers. However, the previously empty shaded box has been expanded into a large shaded area with many boxes in order to display separately the industries producing (as well as consuming) raw materials, semifinished products, and intermediate services.

These industry-to-industry flows depict the input-output structure of the economy. For example, the manufacturing row shows the sales by manufacturing industries to each of their industrial customers (intermediate markets) as well as to the final markets; the column for manufacturing shows the industrial sources of the goods and services used in production, and also the value added by manufacturers.

Because the interindustry account is conceptually and statistically integrated with the national income and product account, the value of total GNP as well as of the flows to each of the final markets (personal consumption, gross private domestic investment, government purchases, and net exports) is the same in the two sets of accounts. However, the breakdown of the flows differs in the two accounts. In the interindustry account, the detail in the final demand columns is classified by industry. For the national income and product account, other types of breakdowns are shown.

Value added is shown by component in the national income and product account. In the input-output tables presented in this chapter the components are combined into "value added" totals. Although the sum of value added for all industries is identical in the two accounts, the industrial distribution of value added in the I-O tables differs from that of the national income and product account due to certain statistical and conceptual differences.

Table III. Input-Output Flow

		Producers								Final markets			
		Agriculture	Mining	Construction	Manufacturing	Trade	Transportation	Services	Other	Persons	Investors	Foreigners	Government
Producers	Agriculture												
	Mining												
	Construction												
	Manufacturing												
	Trade												
	Transportation												
	Services												
	Other												
Value added	Employees	Employee compensation											
	Owners of business and capital	Profit-type income and capital consumption allowances											
	Government	Indirect business taxes and current surplus of government enterprises, etc.											

Personal consumption expenditures; Gross private domestic investment; Net exports of goods and services; Government purchases of goods and services

Gross national product

F 668–696. Value of input-output transactions among industries in the U.S. economy, 1947–1967.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1947, "The Input-Output Structure of the United States Economy: 1947," March 1970 (duplicated); 1958, "The Transactions Table of the 1958 Input-Output Study and Revised Direct and Total Requirements Data," *Survey of Current Business*, September 1965; 1961, "Input-Output Transactions: 1961," Staff Working Paper in Economics and Statistics, No. 16, 1968; 1963, "The Input-Output Structure of the U.S. Economy: 1963," *Survey of Current Business*, November 1969; 1967, "The Input-Output Structure of the U.S. Economy: 1967," *Survey of Current Business*, February 1974.

The interindustry transactions table shows the value in current dollars of transactions among the various industries for a given year. Each row displays the distribution to every industry and to final users of the output of goods or services of that industry. The columns show the values of each industry's consumption (inputs) of raw materials, semifinished products and services, and its value added.

The industrial classification used to present the data in series F 668–696 combines all production activities of the U.S. economy into 23 industries. This is a condensation of the industrial classification used for the original basic tables. The condensation represents combinations of industries as defined in the *Standard Industrial Classification (SIC) Manual*, 1957 edition. A list of the industrial categories and their composition in terms of both the SIC and the I-O industry classification is given in table IV.

Table IV. Industry Classification of the Input-Output Tables

Industry number and title	Related SIC codes (1957 edition)	Detailed I-O industry numbers
1. Agriculture, forestry, and fisheries	01–09 (ex. 0722)	1–4
2. Metal mining	10	5, 6
3. Petroleum and natural gas mining	13 (ex. 138)	8
4. Other mining	11, 12, 14	7, 9, 10
5. Construction	15–17, 138, pt. 6561	11, 12
6. Food, feed, and tobacco products	20, 21	14, 15
7. Textile products and apparel	22, 23, 3992	16–19
8. Wood products and furniture	24, 25	20–23
9. Paper, printing, and publishing	26, 27	24–26
10. Chemicals and chemical products	28 (ex. 28195)	27–30
11. Petroleum and coal products	29	31
12. Rubber, plastics, and leather	30, 31	32–34
13. Stone, clay and glass products	32	35, 36
14. Primary and fabricated metals	33, 34, 28195	37–42
15. Machinery, except electrical	35	43–52
16. Electrical equipment and supplies	36	53–58
17. Transport equipment and ordnance	37, 19	59–61, 13
18. Other manufacturing	38, 39	62–64, 82
19. Transportation and trade	40–47, 50, 52–59, 7396	65, 69
20. Electric, gas, water, and sanitary services	49	68
21. Other services	48, 60–89 (ex. 7396, pt. 6561), 0722	66, 67, 70–77, 81
22. Government enterprises	----------	78, 79
23. Scrap and secondhand goods	----------	83
Directly allocated imports	----------	80a
Transferred imports	----------	80b
Value added	----------	[1]
Final demand:		
Personal consumption expenditures		
Gross private domestic investment		
Exports		
Government purchases		

[1] For the condensed tables shown here in Chapter F, industries 84–87 in the detailed I-O classification are shown as value added originating in the appropriate final demand sector; thus, compensation paid household employees reflects value added resulting from personal consumption expenditures; the inventory valuation adjustment originates in gross private domestic investment; factor payments received by U.S. residents from foreign sources are part of exports; and the compensation of government employees is a government purchase.

The definitions and conventions used in constructing the input-output data for this series are as follows:

Trade. To show the links between producing industries and consuming industries or final markets, the input-output data reflect commodities as moving directly from producer to user, by-passing trade. If trade were shown as buying and reselling commodities, the detailed connections would be between trade and the producing industries, while the consuming industries and final users would make most of their purchases from a single source, trade, and the relationship between producer and consumer would be lost. The output of trade is measured in terms of total margins—that is, operating expense plus profit.

Valuation of transactions. The valuation underlying the data in these series is based on producers' prices. Such prices exclude the distribution costs which make up the difference between producers' and purchasers' prices. Under a system of producers' valuations, the individual inputs into a consuming industry are valued at producers' prices and the trade and transportation margin costs associated with delivery of these inputs appear as inputs to the consuming industry from the trade industry and transportation industry, respectively.

Secondary products or activities. In most cases, secondary products are treated as if sold by the producing industry to the primary industry and added to the output of the primary industry for distribution to users.

The basic unit of classification in the SIC is the establishment. An establishment is classified in an industry according to its principal activity. However, once an establishment is classified in an industry, its entire output, subsidiary as well as principal, is counted as part of the output of the industry. Its principal output, that which determines its industry classification, is called primary output; its subsidiary output is called secondary. In several industries for which secondary production is large and, at the same time, considerably different from the primary output, the secondary products, and their associated inputs, are subtracted from the producing industries and added to the primary industry. For example, self performed new and maintenance construction are shifted from the industries where they occur to the appropriate construction industry.

Imports. Imports used in production (intermediate goods and services) which are substitutable for domestically produced goods and services are treated like secondary products; they are shown as if purchased by the industry producing the substitutable item and added to that industry's output. Substitutability was determined on a judgmental basis, using the following guide: the import should be interchangeable with a domestically produced item and not require any changes in the technology of the consuming industry or the resultant product.

Imports used in production which have no domestic counterparts, and imports purchased by final users in substantially the same form in which they were imported, are shown as purchased directly by the consuming industry or final market.

Gross output and gross input. Gross output of an industry represents the sum of the values of the following elements: (a) The total production by the industry, including both primary and secondary products or services; (b) the producers' value of the secondary products or services of other industries which are primary to the given industry; and (c) the domestic port value of substitutable imports, which are distributed as part of the output of the given industry.

Gross input of an industry is equal to the sum of the values of the following elements: (a) Total consumption of goods and services required for the industry's total production; (b) value added by the industry; (c) the producers' value of the secondary products or services of other industries which are primary to the given industry; and (d) the domestic port value of substitutable imports. Thus, secondary products and substitutable imports are added to both the inputs and outputs. Gross output, the row total, equals gross input, the column total.

Inventories. Inventory change, which is part of gross private domestic investment, series F 692, is defined as the change in inventories of the industry's primary products regardless of which industry actually owns or holds the inventories. (This is different from the customary inventory data, which represent inventories held by each industry.) Inventories are so classified in the input-output table in order to provide the balance between the output of each industry and the total consumption of its products. Current production includes products which end up in inventories and are therefore not reflected in consumption. On the other hand, consumption may come from inventories of the producer, of the consumer, or of trade companies as well as current output. To the extent it comes from inventories, it is not included in current production. Therefore, adding increases in inventories of products of the industry to, and subtracting depletions from, the consumption of that industry's products achieves the balance with gross output of the industry.

The source for 1967 shows the I-O data in 85-industry detail and eight final demand sectors. The data are also published in 367-industry detail and ten final demand sectors in a supplement to the *Survey of Current Business*. The 1967 transactions table provides benchmark data which will be used in revising the national income and product accounts.

The source for 1963 shows the I-O data in 85-industry detail and six final demand sectors. The data were also published in 1969 in 367-industry detail and ten final demand sectors in *Input-Output Structure of the U.S. Economy: 1963*, a three volume supplement to the *Survey of Current Business*. The 1963 data provide benchmarks for the national income and product accounts, but they have not yet been incorporated into the series.

Other articles containing data relating to the 1963 I-O study and published in the issues of the *Survey of Current Business* noted below are as follows: Allan H. Young and Claiborne M. Ball, "Industrial Impact of Residential Construction and Mobile Homes," October 1970; "Personal Consumption Expenditures in the 1963 Input-Output Study," January 1971; Allan H. Young, Leo C. Maley, Jr., Sally R. Reed, and Roy A. Seaton II, "Interindustry Transactions in New Structures and Equipment," August 1971; Albert J. Walder-

haug, "The Composition of Value Added in the 1963 Input-Output Study," April 1973; and Philip M. Ritz and Eugene P. Roberts, "Industry Inventory Requirements: An Input-Output Analysis," November 1973.

The 1961 I-O data were developed as part of a program to maintain input-output data on as current a basis as possible. The interindustry transactions data for 1961 were obtained by updating BEA's 1958 input-output data. They incorporate a mixture of actual data for 1961 and summary updating of the base year relationships contained in the 1958 benchmark data.

In the updated data for 1961, the total output of each industry and a major portion of the final market purchases were based directly on 1961 statistics. In addition, the updated data incorporate allowances for changes from 1958 to 1961 in the relative prices of the inputs to each industry and for the average change in the use of a product as a result, for example, of changes in technology, scale of operation, and product mix within an industry. The allowances for changes in relative prices involved a much more detailed repricing of inputs than that which has been contained in updated data prepared by others. However, in general, the data do not incorporate allowances for variation from the average change in the use of a product among industries.

The 1958 Input-Output Study provided the benchmarks for the national income and product accounts series. The transactions data are, therefore, completely integrated with the national accounts and the published totals for the major component of GNP in the two sets of data agree. The 1958 study presents data for 86 intermediate industries and six final demand sectors.

Other articles appearing in issues of the *Survey of Current Business* relating to the 1958 study are: Morris R. Goldman, Martin L. Marimont, and Beatrice N. Vaccara, "The Interindustry Structure of the United States," November 1964; Norman Frumkin, "Construction Activity in the 1958 Input-Output Study," May 1965; Nancy W. Simon, "Personal Consumption Expenditures in the 1958 Input-Output Study," October 1965; and "Additional Industry Detail for the 1958 Input-Output Study," April 1966.

The 1947 data shown here represent a reworking of the 1947 input-output figures originally prepared by the U.S. Bureau of Labor Statistics. The data were revised to be integrated with the national income and product accounts and to be conceptually and statistically consistent with the input-output data for 1958 and 1963 developed by the Office of Business Economics.

This reworking involved the reorganization of the basic information, which reflected the 1945 and 1949 Standard Industrial Classifications, to make it conform to the revised 1957 Standard Industrial Classification and the sectoring scheme of the 1958 data. It also required numerous adjustments to the output and input data to change the original 1947 definitions of the various intermediate industries and final demand sectors to reflect those used for the 1958 data. Unfortunately, it was not possible to reconcile completely the final demand estimates of the input-output data with the already predetermined GNP components. As a consequence, the 1947 GNP total of $233.367 billion yielded by the input-output data was $2 billion higher than the published GNP total of $231 billion. The bulk of this $2 billion difference is accounted for by differences of $1 billion in personal consumption expenditures, primarily for food, and $800 million in Federal Government purchases.

F 697–719. Direct requirements per dollar of gross output, 1947–1967.

Source: See source for series F 668–696.

The direct requirements data for each year are derived from the respective interindustry transactions table. They relate each of the inputs of an industry to its total output. Each column shows the inputs that the industry named at the top of that column requires from each of the industries named at the beginning of the rows to produce a dollar of its output. For example, to produce a dollar of output in 1967, the chemical manufacturing industry, series F 706, required 22 cents of its own production, 4 cents from the petroleum and coal products industry (11), 2 cents of other mining products (4), etc.

The data in series F 697–719 permit the tracing of the interconnections among the various industries and final demand in a systematic way. For example, assume that in 1967 the wood products and furniture industry produces $1 million of products for sale to consumers. By use of series F 704 it can be established that the industry would require slightly more than $220,000 ($1,000,000 × 0.22089) of the products supplied by other producers in the same industry. Thus, the wood products and furniture industry would have to produce a minimum of $1,220,000. Continuing the calculation, this output would require almost $29,400 ($1,220,000 × 0.02408) of textile products from industry 7, about $68,000 ($1,220,000 × 0.05574) of primary and fabricated metal products from industry 14, and so on down the column.

The next calculation is that of the output required by each of the supplying industries to meet the requirement that has been placed on it. For example, the wood products and furniture industry has so far required $29,400 of textile products from industry 7. To meet this requirement, industry 7 (series F 703) needs another $12,000 ($29,400 × 0.40880) of its own products for a total of $41,400. To produce this, it will require $2,900 ($41,400 × 0.07112) of chemical products from industry 10.

This chain of calculations of the output requirements which spread through the economy can be continued, and the total output required from each industry to produce $1 million of wood products and furniture for consumers can thus be derived. This is a very laborious and time-consuming procedure when done by hand, but it can be performed rapidly on an electronic computer with established programs. Although not shown here, this calculation has been carried out for each of the I-O tables at the more detailed level of industry classification. The sources cited for each year for series F 668–696 also contain a table of *total requirements* (direct and indirect) per dollar of an industry's product delivered to final demand—in addition to the interindustry transactions data and the direct requirements data.

The relationship among inputs required to produce one unit of an industry's product is mainly technical, particularly if one abstracts from price changes. Assuming that these technical requirements do not change rapidly over time one can use the relationships described in the input-output data to examine the likely impact of projected or hypothetical situations on producing industries in the nation.

F 720–723. Industrial composition per dollar of purchases, by final demand categories, 1947–1967.

Source: See source for series F 668–696.

The ratios in series F 720–723 relate each industry's sales for a particular end use to total sales to (purchases in) the final demand category. The differing industrial composition of the purchases in each of the final demand categories highlights the varying impacts on the producing industries of the economy that a dollar of each type of final expenditure can have.

However, there is no structural relationship, in a technological sense, between the purchases from individual industries and total purchases in a final demand category. Accordingly, there is no reason to expect the same sort of stability over time in these ratios as in the case of input ratios for the producing industries shown in series F 697–719.

– Represents zero. Z Less than $500,000.

[1] The industrial distribution of inventory change included in this column represents the change in inventories of primary products of an industry (wherever held), rather than change in all inventories held by an industry. For input-output table, the inventory valuation adjustment has been made in total only and appears on the value-added row.

[2] The detailed entries reflect gross exports of goods and services from each producing industry. Imports in total are shown as negative entries in this column on the import rows. Therefore, the sum of the column equals GNP component "net exports of goods and services."

[3] Final purchases are shown net of sales; this can result in negative entries where sales exceed purchases.

Industries in the U.S. Economy: 1947 to 1967—Con.

row for that industry; for the composition of inputs to an industry, read the column for that industry]

[4] Entry in each row represents the value of the secondary output of the industry named at the beginning of the row which has been transferred to primary producing industries.

[5] Entry in each column represents the sum of the value of transferred imports at domestic port value and the value of the secondary output of other industries which has been transferred to the industry named at the head of the column. See text.

[6] The subtotal for intermediate inputs is not relevant in the final demand sector. These entries are overall adjustments to the respective columns to reflect purchases by foreigners in the U.S. and aid in kind sent abroad which were shifted from the personal consumption expenditures and government sectors of final demand without adjusting the detailed entries in the respective column.

[7] Entry reflects net factor receipts; i.e., earnings of foreigners from their investments in the U.S. have been deducted from gross earnings from abroad of U.S. citizens.

Series F 697–719. Direct Requirements Per

[In dollars, producers' prices. For composition of

Industry No.	Consuming industry / Producing industry	Agriculture, forestry, and fisheries	Metal mining	Petroleum and natural gas mining	Other mining	Construction	Food, feed, and tobacco products	Textile products and apparel	Wood products and furniture	Paper, printing, and publishing

Chapter G

Consumer Income and Expenditures

Family and Individual Income (Series G 1-415)

G 1–415. General note.

The development of reasonably reliable nationwide estimates of income distribution for families and individuals was dependent on the availability of comprehensive basic source material from Federal individual income tax returns and from representative sample field surveys of family incomes. Annual tabulations of tax-return data originated during World War I, but until the 1940's, when the minimum income requirement for filing returns was substantially lowered, these tabulations provided information for only a small fraction of the upper-income population. Sample field surveys of family incomes that were designed to cover all income and occupation groups in the Nation were not introduced until the 1930's.

Reflecting the lack of adequate source data, the early estimators of income distribution had to piece together various sets of sample income statistics that were available for selected occupation groups or local areas, and combine these figures with income data from State or Federal income tax returns or with income distribution series derived by applying yield rates to estimated size-class distributions of wealth. Among the early estimators were Charles B. Spahr who constructed a family income distribution in 1896, Willford I. King who developed income distribution estimates by size-class for families for 1910, and for individuals for 1921 and 1928, Frederick R. Macaulay who constructed income distributions for individuals for 1918, and Maurice Leven who did the same for families and individuals for 1929.

The following publications relate to these early efforts:

C. L. Merwin, "American Studies of the Distribution of Wealth and Income by Size," *Studies in Income and Wealth,* vol. 3, Conference on Research in Income and Wealth, National Bureau of Economic Research, New York, 1939.

Charles B. Spahr, *The Present Distribution of Wealth in the United Slates,* New York, 1896.

Willford I. King, *Wealth and Income of the People of the United States,* New York, 1915; also unpublished manuscript at the National Bureau of Economic Research, New York.

W. C. Mitchell, W. I. King, F. R. Macaulay, and O. W. Knauth, *Income in the United States,* National Bureau of Economic Research, New York, 1921 and 1922.

Maurice Leven, H. G. Moulton, and Clark Warburton, *America's Capacity to Consume,* The Brookings Institution, Washington, D.C., 1934.

The Consumer Purchases Study of 1935–36 was the first sample field survey in the United States in which income data were collected from all types of families without restriction as to occupation or earnings group. Based largely on the 300,000 family income schedules collected in that study and on tax returns for upper incomes, the National Resources Committee constructed estimates of family income, by income size-class, for a 12-month period during 1935 and 1936. Aside from their firmer statistical basis, the figures developed by Dr. Hildegarde Kneeland and her staff represented a marked improvement over earlier estimates by providing separate income distributions for numerous subgroups, e.g., for families classified by major occupation of the head, type and size of community, region, color, and family size. (See National Resources Committee, *Consumer Incomes in the United States: Their Distribution in 1935–36,* Washington, D.C., 1938.)

The Survey of Spending and Saving in Wartime provided the only other pre-World War II statistics on the distribution of families, by total income brackets, on a nationwide basis. This survey for 1941, though much smaller in size than the 1935–36 study, represented a further advance in that the sample of families selected for interview was designed specifically for the purpose of "inflating" the results to produce nationwide estimates of family income distribution. (See Bureau of Labor Statistics, *Family Spending and Saving in Wartime,* BLS Bulletin 822, 1945; also Bureau of Human Nutrition and Home Economics, *Rural Family Spending and Saving in Wartime,* U.S. Department of Agriculture Misc. Publication No. 520, 1943.)

Detailed distributions of families, and of persons 14 years old and over, by size-class of their money wage and salary income in 1939, were provided by the 1940 Census of Population, the first decennial census to include income questions. For items of income other than wages or salaries, the census obtained only a "yes" or "no" response as to the receipt of $50 or more, so that over-all size-class distributions on a total income basis are not available. A 5-percent sample of these returns was tabulated with extensive cross-classifications. For many types of analysis, e.g., for studying occupational differentials in wage-salary earnings distribution, these tabulations for 1939 comprise the best available data for comparisons between the prewar and postwar periods. (See Bureau of the Census, *Population—The Labor Force (Sumple Statistics): Wags or Salary Income in 1939;* and *Population—Families: Family Wage or Salary Income in 1939.* For other decennial census reports that include income data, and for list of available tabulations, see Edwin D. Goldfield, "Decennial Census and Current Population Survey Data on Income," *Studies in Income and Wealth,* vol. 23, Conference on Research in Income and Wealth, National Bureau of Economic Research, Princeton, 1958.j

For post-World War II years, annual nationwide sample survey data are available from two sources: The annual current population surveys of the Census Bureau which present distributions by total money income brackets for families and for persons 14 years old and over for 1944–1970; and the annual surveys of consumer finances conducted by the Survey Research Center of the University of Michigan, which furnish distributions by total money income brackets for families and for "spending units" for 1945–1969. Income size-class distributions from both these sets of sample survey data are available for numerous subgroups of the population. (See Bureau of the Census, *Current Population Reports: Consumer Income,* series P-60, Nos. 1–80, and series P-S, Nos. 22 and 22-S; and Board of Governors of the Federal Reserve System, "1958 Survey of Consumer Finances: The Financial Position of Consumers," *Federal Reserve Bulletin,* September 1958, and corresponding articles for earlier years.)

A historical and analytical summary of the income data collected in the Current Population Survey appears in Technical Paper No. 17, *Trends in the Income of Families and Persons in the United States: 1947 to 1964,* published in 1967. This report contains detailed tables showing income distributions in constant (1964) dollars, mean incomes, fifths, and Gini Ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, nonfarm and farm. Similar data are also shown for males and females classified by the amount of their own income and various personal characteristics.

Also available for the postwar years are data published from the

1950, 1960, and 1970 censuses of population. These three censuses provide detailed cross-classifications for large areas and less detailed data for smaller areas. Moreover, they provide data on the level of total money income for families and persons 14 years old and over in addition to data on wage and salary income, whereas the 1940 Census of Population provided data covering primarily wage and salary income only. (For a discussion of the 1970 census publication program, see Bureau of the Census, 1970 *Census of Population and Housing*, "Publication and Computer Tape Program"; for the 1960 census, see Bureau of the Census, 1960 *Censuses of Population and Housing: Procedural History* or *Guide to Census Bureau Data Files and Special Tabulations*.

In the 1950 Census of Population the income questions covered all items of money income, not just wages and salaries. The tabulations based on this census show separate money income distributions for families for local areas, and for persons 14 years old and over, classified by demographic and socioeconomic characteristics. (See Bureau of the Census, *1950 Census of Population*, vol. II; see also article by Goldfield, cited above.) Comparative distributions for 1939 and 1949 of persons classified by money wage or salary brackets and cross-classified by sex and detailed occupation and industry groups have been compiled from the census material by H. P. Miller. (See Herman P. Miller, *Income of the American People*, John Wiley and Sons, New York, 1955; and "Changes in the Industrial Distribution of Wages in the United States, 1939–1949," *Studies in Income and Wealth*, vol. 23, Conference on Research in Income and Wealth, National Bureau of Economic Research, Princeton, 1958.)

In addition to these nationwide surveys and censuses, other surveys providing income data for selected population groups are the income-expenditure surveys conducted by the Bureau of Labor Statistics, which show urban family income distributions for 1944, 1950, and 1960, several studies of farm family incomes by the Department of Agriculture, and a number of surveys in individual localities conducted by the Bureau of the Census. (See Bureau of Labor Statistics, "Expenditures and Savings of City Families in 1944," *Monthly Labor Review*, January 1946; "City Family Composition in Relation to Income, 1941 and 1944," *Monthly Labor Review*, February 1946; and *Study of Consumer Expenditures, Incomes and Savings, Statistical Tables, Urban U.S.—1950*, vol. XI, *Details of Family Accounts for Incomes, Savings, Insurance and Gifts and Contributions*, tabulated by the Bureau of Labor Statistics for the Wharton School of Finance and Commerce, University of Pennsylvania, 1957; Department of Agriculture and Department of Commerce, *Farms and Farm People, A Special Cooperative Report*, 1953; and *Farmers' Expenditures, A Special Cooperative Survey*, 1956.)

Since 1937, income distributions are also available for workers covered under the old-age, survivors, disability, and health insurance (OASDHI) program. These figures show workers classified by size brackets of "covered" wages and salaries (and, since 1951, "covered" self-employment income). The group of workers covered by these series was substantially expanded in the post-World War II period, but the usefulness of the series is limited by the upper limit for "covered" earnings. The upper limit was $3,000 prior to 1951, $3,600 for 1951–1954, $4,200 for 1955–1958, $4,800 for 1959–1965, $6,600 for 1966–1967, and $7,800 for 1968–1970. (See Social Security Administration, *Social Security Bulletin, Annual Statistical Supplement, 1971*, and earlier issues.)

Distributions of Federal individual income tax returns by income bracket are available annually since 1913. Until World War II, the minimum filing requirements were relatively high so that the tabulations covered only a small fraction of the population. Successive lowering of the filing limit coupled with the rise in incomes after the depression of the 1930's led to a very marked expansion in coverage so that very few groups of the population are excluded in the postwar tabulations. (See Internal Revenue Service, *Statistics of Income, Individual Income Tax Returns*, annual.)

Tax-return data have been used in several studies to measure changes in relative income distribution over time. Rufus Tucker applied measures of dispersion to tax-return distributions for 1863–1935. He included in his series some less reliable tax data for the Civil War period. (See Rufus S. Tucker, "The Distribution of Income Among Income Taxpayers in the United States, 1863–1935," *Quarterly Journal of Economics*, vol. LII, 1938, pp. 547–587.) The most detailed study of the tax-return statistics is that by Simon Kuznets (see text for series G 337–352).

A number of the family income distribution estimates for the pre-World War II period were developed by integrating tax-return and survey data. Among them are the estimates of The Brookings Institution for 1929 and the National Resources Committee for 1935–36, both cited earlier, and the Survey of Spending and Saving in Wartime distribution for 1941 as subsequently adjusted in the light of tax-return data by Joseph Pechman. (See Joseph Pechman, "Distribution of Income Before and After Federal Income Tax, 1941 and 1947," *Studies in Income and Wealth*, vol. 13, Conference on Research in Income and Wealth, National Bureau of Economic Research, New York, 1951.) In developing these prewar distributions, data from Federal individual income tax returns could be used only to construct estimates for the top ranges of the family income scale, which were then linked directly to field survey data for the low and middle income brackets.

The much broader coverage of Federal individual income tax returns introduced in World War II, coupled with the availability of annual postwar sample survey data, made possible the construction of family income distributions for the postwar period that are more firmly based statistically than the earlier estimates. As part of its national income work, the former Office of Business Economics, now the Bureau of Economic Analysis, developed distributions of families and family income by brackets of family personal income for 1944, 1946, 1947, and for each year, 1950–1964, by combining the two sets of source data and adjusting the results so that they accord statistically and definitionally with the personal income series prepared in that office. (See Office of Business Economics, *Income Distribution in the United States by Size, 1944–1950*, 1953; revised and brought up to date in articles on income distribution in the *Survey of Current Business*, March 1955, June 1956, April 1958, 1969, and 1964.)

In order to derive meaningful comparisons over time, the family distributions for the prewar period required adjustment to make them consistent, with postwar series. Adjusted family income distributions reasonably comparable with the postwar series of the Office of Business Economics were developed for 1935–36 and 1941 by Selma Goldsmith, et al (see source cited for series G 269–296 for 1935–36 and 1941). Mrs. Goldsmith also adjusted the figures in The Brookings Institution study for 1929 to remove the major elements of incomparability. (See Selma F. Goldsmith, "The Relation of Census Income Distribution Statistics to Other Income Data," *Studies in Income and Wealth*, vol. 23, Conference on Research in Income and Wealth, National Bureau of Economic Research, Princeton, 1958.)

Direct comparability among income distribution series is frequently precluded by variations in definition or coverage which are due in many instances to the different purposes for which the data were collected. Definitional differences may apply to the basic unit of classification, to the definition of the income measure, or to the time period to which the income data or the definition of the family unit refers. (See Simon Kuznets, "The Why and How of Distributions of Income by Size," *Studies in Income and Wealth*, vol. 5, Conference on Research in Income and Wealth, National Bureau of Economic Research, New York, 1943, and "Economic Growth and Income Inequality," *American Economic Review*, March 1955, vol. XLV, No. 1; Dorothy S. Brady, "Research on the Size Distribution of Income," *Studies in Income and Wealth*, vol. 13, Conference on Research in Income and Wealth, National Bureau of Economic Research, New York, 1951; and *Income Distribution in the United States . . .*, cited above.) For measures of the effect of alternative income definitions on changes observed over time in relative income shares of top income groups, see Selma F. Goldsmith, "Changes in the Size Distribution of Income," *American Economic Review*, May 1957, vol. XLVII, No. 2.

The income data presented here are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (BEA), nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau. The lack of correspondence stems from the following differences in definition and coverage:

(1) *Income definition.* The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition. Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 4 percent of total personal income. The Census Bureau definition of income includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

(2) *Source of data.* The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports are based directly on field surveys of households.

(3) *Coverage.* The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition, the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by BEA but is excluded from the BEA family income distributions.

Furthermore, income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 89 percent of the comparable total money income aggregates derived from the personal income series prepared by BEA.

Additional information concerning comparability with other data sources can be found in *Current Population Reports,* Consumer Income series P-60, No. 85.

For the pre-World War II period, also, direct comparison is not warranted between certain sets of income distribution statistics. For example, for 1941, the income classification in series G 813–827 is in terms of family money income brackets, and in series G 269–296, it is in terms of family personal income brackets. For 1929 and 1935–36, the income for series G 828–848 and for series G 269–296 are not directly comparable because of adjustments incorporated in the latter as noted above.

G **1–268.** General note.

Estimates for these series are based on sample data obtained in the Current Population Survey (CPS) of the Bureau of the Census. Most of the data were collected in March of the year following the year stated. For 1967–1970, the sample was spread over 449 areas comprising 863 counties and independent cities, with coverage in each of the 50 States and the District of Columbia. Approximately 50,000 households are designated in the CPS for interview each month. In addition, there are about 8,500 sample units in an average month which are visited but are found to be vacant or otherwise not enumerated. Prior to 1967, the sample was spread over fewer households. Prior to the March 1966 survey, income data were collected from only 75 percent of the households included in the **CPS.**

For each person, 14 years old and over, in the sample, questions were asked concerning money income received in the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security payments; (5) dividends, or trusts, or net rental income; (6) public assistance or welfare payments; (7) unemployment compensation, government employee pensions, or veterans' payments; (8) private pensions, annuities, alimony, regular contributions from persons not living in the household, and other periodic income. G **139–178.** Percent distribution of families ranked by fifths according to money income received, by selected family characteristics, **1950, 1960,** and **1970.**

Source: **U.S.** Bureau of the Census, *Current Population Reports,* series P-60, No. 80, and unpublished data.

For composition of regions, see text for series A 172–194; for definition of race, see text for series A 91–104.

G **140-141.** The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the 1970 survey is the same as that used in the 1960 census and in the Current Population Surveys since 1960, but differs from that used in earlier surveys and censuses. For definitions, see text for series A 73–81.

G **146-157** and **G 175–178.** One person in each family was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. Married couples related to the head of a family are included in the head's family and are not classified as separate families,

See also general note for series G 1–268.

G 179–188. Number and median money income of families and unrelated individuals, **1947–1970.**

Source: See source for series G 1–15.

Median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The medians for families and individuals are based on all families and individuals.

The base figures for 1961 to 1970 were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1960 Census of Population. The data for years prior to 1961 were based on the 1950 census.

G 205–256. Median money income of families, by States, **1949, 1959,** and **1969.**

Source: U.S. Bureau of the Census. 1949, *U.S. Census of Population: 1960,* vol. I; 1959 and 1969, *U.S. Census of Population: 1970,* vol. *I.*

The income data collected in the 1950 and 1960 censuses are basically similar to the 1970 census data, but there are variations in the detail of the questions. In 1960, information on income was obtained from all members in every fourth housing unit and from every fourth person 14 years old and over living in group quarters. Each person was required to report (a) wage or salary income, (b) net self-employment income, and (c) income other than earnings received in 1959. Between the 1960 and 1970 censuses, there were also some changes in the processing of the data. In the 1960 census, an assumption was made in the editing process that no other type of income was received by a person who reported the receipt of either wage and salary income or self-employment income but who had failed to report the receipt of other money income. This person was considered as unallocated. In the 1970 census, this assumption was not made. Generally, all missing values were imputed either as "none" or as a dollar amount. If a person reported a dollar amount in (a) wage or salary income, (b) net nonfarm self-employment income, or (c) net farm self-employment income, he was designated as unallocated only if no further dollar amounts were imputed for any additional missing entries.

In both the 1960 and 1970 censuses, all nonrespondents on income (whether heads of families or other persons) were assigned the reported income of persons with similar characteristics.

In 1950, information on income was obtained from every fifth person 14 years old and over. If the sample person was the head of the family, the income questions were repeated for the other family members as a group in order to obtain the income of the whole family. In the tabulations of family income for the 1950 census, if only the head's income was reported, it was assumed that there was no other income in the family.

G 269–296. Percent distribution of families **and** unattached individuals and **of** aggregate personal income among families and unattached individuals, by family personal income levels, **1929–1964,**

Source: 1929, Selma F. Goldsmith, "The Relation of Census Income Distribution Statistics to Other Income Data," *Studies in Income and Wealth,* vol. 23, National Bureau of Economic Research, New York, 1958 (copyright); 1935–1936 and 1941, Selma F. Goldsmith, George Jaszi, Hyman Kaitz, and Maurice Liebenberg, "Size Distribution of Income Since the Mid-Thirties," *Review of Economies and Statistics,* February 1954 (copyright, Harvard College); 1944–1962, U.S. Office of Business Economics, *Survey of Current Business,* April 1958 and April 1964; 1964, Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," *Bureau of Economic Analysis, StuffPaper No. 21,* June 1973.

The definitions of families and unattached individuals in these series conform with those used by the Census Bureau. Families are units of two or more persons related by blood, marriage, or adoption, and residing together; unattached (unrelated) individuals are persons (age 14 or over) other than institutional inmates who are not living with any relatives. For years prior to 1964, the total number of families and unattached individuals was estimated as of the end of the calendar year to which the income data pertained (for 1935–36, the estimate refers to July 1, 1936). It was derived, for most years, by interpolating between Census Bureau figures after adjustment to exclude certain minor groups of individuals. For 1964, the total number of families and unattached (unrelated) individuals was estimated as of the middle of March 1965, the date of the Current Population Survey from which the estimates were obtained.

Personal income represents the current income received by families and unattached individuals from all sources. For years prior to 1964, it included wage and salary receipts and proprietors' income (both net of social insurance contributions), other labor income, rental income, dividends, personal interest income, and transfer payments. For 1964, the definition differed slightly in that employer contributions to private pension, health, and welfare funds (a component of other labor income) were excluded and private pension and annuity payments received were included. In addition to monetary income, family personal income for all years includes certain nonmoney items such as wages in kind, the value of food and fuel produced and consumed on farms, the net imputed rental value of owner-occupied homes, and imputed interest. Total personal income is a somewhat smaller amount in each year than the personal income aggregate from which it is derived, because it excludes the income received by certain types of recipients, such as institutional residents (including military personnel not living with their families) and nonprofit institutions.

For discussion of the earlier definitions, see Office of Business Economics, *Income Distribution in the United States by Size, 1944–1950,* 1953. The 1964 definitions are discussed in Budd, Radner, and Hinrichs, cited above for 1964. For limitations of the pre-World War II distributions affecting comparability with the postwar series (excluding 1964), see source for prewar figures. 1964 data are of limited comparability with 1962 and earlier data because a different estimating methodology (described in Budd, Radner, and Hinrichs) was used for 1964.

See also general note for series G **1–415.**

G 297–305. Percent distribution of families and unattached individuals and family personal income, by income level in **1950** dollars, **1929–1957.**

Source: 1929, see first source for series G 269–296, p. 93; 1935–36 to 1944, see second source for series G 269–296; 1950, U.S. Office of Business Economics, *Survey of Current Business,* April, 1959, p. 14; 1957, unpublished data.

1957 data were computed by applying the OBE price index used for deflating personal consumption expenditures (of the national income accounts) to the income distribution expressed in current

dollars for that year; the latter appears in the *Survey* of *Current Business*, April 1959, p. 11. For definitions of terms, see text for series G 269–296.

The price-deflated income size distributions such as are shown here represent only approximate measures of real income distribution because separate price indexes applicable to the various income brackets are not available. It is therefore necessary to use the same index throughout the income range even though all brackets may not have been affected by the price rise in the same way. Moreover, available price indexes which refer to consumer expenditures for goods and services must be applied to income totals that include income taxes and saving as well as outlays for consumption. For interpolation procedures used in deflating income size distributions, see Office of Business Economics, *Income Distribution in the United States by Size, 1944–1950*, p. 38.

Because of inadequacies in the basic source data, the estimates for 1929 are less reliable than for other years in the series. For limitations of the prewar data, see the sources.

Budd, Daniel B. Radner, and John C. Hinrichs, "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," *Bureau of Economic Analysis, Staff Paper No. 21*, June 1973, and U.S. Bureau of Economic Analysis, unpublished data).

For definitions of terms, see text for series G 269–296.

Farm-operator families cover all families operating farms as defined in the census of agriculture; the total number is estimated annually by the Agricultural Marketing Service. (See general note for series K 1–208.) Nonfarm families include all multiperson units other than farm-operator families.

G 319–336. Family personal income received by each fifth and top 5 percent of families and unattached individuals, 1929–1964.

Source: 1929, series G 319–324, see source for 1929, series G 297–305, p. 92; 1929, series G 325–336, unpublished tabulations underlying estimates shown in source for 1929, series G 297–305; 1935–36 and 1941, see source for same years, series G 269–296, p. 9; 1944–1947, U.S. Office of Business Economics, *Income Distribution in the United States by Size, 1944–50*, 1953, p. 81; 1950–1954, *Survey of Current Business*, April 1958, p. 17; 1955–1962, *Survey of Current Business*, April 1964, p. 16; 1964, Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," *Bureau of Economic Analysis, Staff Paper No. 21*, June 1973, and U.S. Bureau of Economic Analysis, unpublished data.

For definitions of terms, see text for series G 269–296.

G 337–352. Percent shares of total income received by top 1 percent and 5 percent of total population, 1913–1948.

Source: Simon Kuznets, *Shares of Upper Income Groups in Income and Savings*, National Bureau of Economic Research, New York, 1953, pp. 582, 585, 635, 637, 646, and 649 (copyright).

The top percentiles in these series represent the 1 or 5 percent of men, women, and children covered on those individual income tax returns reporting the largest per capita incomes in each year. The basic variant is the total of employee compensation, entrepreneurial income, rent, interest, and dividends; the economic variant represents the basic variant adjusted to allow for such factors as the nonreporting of State and local government salaries prior to 1938, the omission of imputed rent on owner-occupied houses, and, most important, the effects of classifying the tax data by an inappropriate base and unit; the disposable income variant is derived by deducting from the economic income variant Federal income taxes paid, and adding the net balance of realized gains and losses from sales of assets.

G 353–371. Median money wage or salary income of primary families and unrelated individuals with wage or salary income, by selected characteristics, 1939–1970.

Source: U.S. Bureau of the Census, *Current Population Reports*, series P-60, Nos. 5, 7, 9, 12, 24, 27, 30, 33, 35, 37, 39, 41, 43, 47, 51, 53, 59, 66, 75, and 80; and unpublished data.

The term "primary family" refers to the head of a household and all other persons in the household related to the head by blood, marriage, or adoption. If no one in the household is related to the head, then the head himself constitutes a "primary individual."

Money wages or salaries are defined as total money earnings received for work performed as an employee during the calendar year, including wages, salary, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

For definitions of race and family head, see text for series A 91–104 and series G 146–157, respectively.

G 372–415. Median money wage or salary income of all workers with wage or salary income, and of year-round full-time workers, by sex, race, and major occupation group, 1939–1970.

Source: U.S. Bureau of the Census, *Current Population Reports*, series P-60, Nos. 9, 11, 14, 16, 19, 23, 27, 30, 33, 35, 37, 39, 41, 43, 47, 51, 53, 60, 66, 75, and 80.

See text for series G 353–371.

More Recent Data for *Historical Statistics* Series

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States*, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract*, see Appendix I in the *Abstract*.

Series G 1–15. Percent Distribution of Families and Unrelated Individuals, by Race of Head, by Money Income Levels: 1947 to 1970

[Families and unrelated individuals as of March following year shown]

Race of head and year	Families								Unrelated individuals

* Denotes first year for which figures include Alaska and Hawaii.

[1] For wage or salary workers at time of survey.

[2] For experienced civilian labor force. 1939 excludes public emergency workers and persons having less than $100 of wage or salary income, but includes members of the Armed Forces; 1950 excludes persons having less than $100 of wsge or salary income.

[3] Fewer than 100 cases in the sample reporting with $1 or more of wage or salary income.

Chapter G

Consumer Expenditure Patterns (Series G 416-915)

G **416-469.** Personal consumption expenditures, **by** type **of** product, **1929–1970.**

Source: U.S. Office of Business Economics, 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965, Statistical Tables,* table 2.5; 1964–1967, *U.S. National Income and Product Accounts, 1964–67,* table 2.5; 1968–1970, U.S. Bureau of Economic Analysis, *Survey of Current Business,* July 1972, table 2.5.

Detailed estimates by the Department of Commerce of consumer expenditures for commodities and services since 1929 were first published in the *Survey of Current Business,* June 1944. The figures on personal consumption expenditures for commodities were calculated by the "commodity flow methods" developed by Simon Kuznets, *Commodity Flow and Capital Formation,* National Bureau of Economic Research, New York, 1938. Estimates of personal consumption expenditures for services are based on a variety of source materials which cannot be summarized briefly. For further detail, see *National Income: 1954 Edition.*

As defined by the Department of Commerce, personal consumption expenditures represent the market value of purchases of goods and services by individuals and nonprofit institutions and the value of food, clothing, housing, and financial services received by them as income in kind. Rental value of owner-occupied houses is included; purchases of dwellings, which are classified as capital goods, are excluded.

G 470–494. Personal consumption expenditures, **by** type **of** product, **1909–1929.**

Source: J. Frederic Dewhurst and Associates, *America's Needs and Resources, A New Survey,* pp. 965–980, © 1955 by The Twentieth Century Fund, New York.

The first detailed estimates of aggregate consumer expenditures for goods and services in the United States over a period of time appeared in William H. Lough (with the assistance of Martin Gainsbrugh), *High-Level Consumption,* McGraw-Hill, New York, 1935. These pioneer estimates covered the years 1909, 1914, 1919, 1921, 1923, 1925, 1927, 1929, and 1931. The data for the later years were revised and extended by Harold Barger, *Outlay and Income in the United States, 1921–1938,* National Bureau of Economic Research, New York, 1942. In the 1940's, J. Frederic Dewhurst and Associates *(America's Needs and Resources,* 1947) revised these various estimates and expanded those on recreational expense to take account of estimates by Julius Weinberger, "The Economic Aspects of Recreation," *Harvard Business Review,* summer issue, 1937.

G **495–848.** General **note.**

Collection of data on consumer expenditures, and especially wage earners' expenditures, began in the United States in the 1870's. It was undertaken on a small scale by a number of different State agencies using **a** great variety of methods. The most substantial of these studies was the one made for Massachusetts by Carroll D. Wright, Bureau of Statistics of Labor, Massachusetts. He undertook a carefully planned survey of the earnings and expenditures of 397 families of skilled and unskilled workers in 1875. The usefulness of the data gathered in this study led the Congress to request further studies of this type on a broader base by the newly formed US. Bureau of Labor of which Wright had become Commissioner.

Some of the results of the large-scale studies made by the U.S. Bureau of Labor for 1888–91 and 1901 are given in series G 554–572. The data on food expenditures obtained in the 1901 survey were used to provide the design for an index of prices of food purchased by workingmen. This index was used generally as a deflator for workers' incomes and expenditures for all kinds of goods until World War I.

During that period, the need for a more inclusive index of retail prices became clearer because food prices rose so much faster than those of many other commodities and of rents. A nationwide study of the expenditures of wage earners and clerical workers was undertaken in 1918 to provide a list of items to be priced for such an index and also to provide data on the relative importance of each item. Because of the number of wage disputes in the shipbuilding centers, the survey was first undertaken in seacoast cities. It was later expanded into what was regarded as a representative sample of industrial centers in the United States.

The first study made in this country of the over-all consumer expenditures of a group of farm families was made in Livingston County, N.Y., in 1909. In the early 1920's, the U.S. Department of Agriculture initiated a cooperative project on the subject with the State Agricultural Experiment Stations under the direction of E. L. Kirkpatrick. In 1925, it was decided, for lack of any other data on farm family expenditures extending across State lines, to average the data that had been collected in 11 States covering one year in the period 1923–1925. The resulting averages given in series G 778–797 have been widely used, but other State studies made in the next few years indicated that the averages for the 2,886 families were too high to be representative of the expenditures of farm-operator families throughout the country at that time.

Dramatic increases in productivity in industry and agriculture during the 1920's and the economic collapse which began in 1929 led a number of economists to study the factors affecting consumer expenditures and to estimate changes in consumption patterns over time. The pioneer investigation in this field was made by Simon Kuznets, *Commodity Flow and Capital Formation,* National Bureau of Economic Research, New York, 1938. This study shows national aggregates for four types of consumer goods and services. The Brookings Institution published, in 1934, estimates of expenditure patterns at different income levels of farm and nonfarm families and single individuals in 1929 (see M. Leven, H. G. Moulton, and C. Warburton, *America's Capacity to Consume,* The Brookings Institution, Washington, D. C., 1934). The figures were prepared by Clark Warburton on the basis of scattered sample studies made during the 1920's and early 1930's and correlated with national income estimates made by Maurice Leven (see text for series G 772–777 and G 843–848). In 1935, estimates of aggregate consumer expenditures in detail for 1909 and 1929 and selected years between were prepared by Martin Gainsbrugh and published in William H. Lough, *High-Level Consumption* (see text for series G 470–494). This book included a comparison with The Brookings Institution's aggregates for 1929, showing that the two estimates were very close for food expense, and reasonably close for attire and home maintenance; but the estimates by Lough and Gainsbrugh of expenditures for all other items were much higher than the Brookings' figures.

In the middle 1930's, two national cross-section studies of consumer expenditure patterns were undertaken. The first, conducted by the Bureau of Labor Statistics, covered employed city wage and clerical workers and was initiated to provide a new list of items and weights for the Consumer Price Index of the Bureau of Labor Statistics. The

second, the Study of Consumer Purchases, conducted jointly by the BLS and the Bureau of Home Economics in the Department of Agriculture, related to families (with native-born heads) who were not on public relief rolls during the survey year, and was initiated to provide data relating the effect on expenditure patterns of income, occupation of the head, race, family composition, and type of community. The results of the second study were used by the National Resources Planning Board as the basis for a national estimate of consumer expenditures (see text for series G 679–696, G 754–771, and G 828–842). The data from this study were supplemented by information from the Bureau of Internal Revenue (now Internal Revenue Service) on income distribution and receipts from excise taxes, and from a few studies of the expenditures of families on public relief rolls and of those with foreign-born heads.

A small nationwide survey covering 1941 conducted by the Bureau of Labor Statistics and the Bureau of Home Economics (see text for series G 661–678 and G 735–753) provides detailed data on the expenditure patterns of rural and urban families in the same year. BLS also conducted a sample national study of urban family expenditures in 1944 (see text for series G 643–660). Another BLS urban study covering 1950, intended primarily to serve as a basis for revision of the Consumer Price Index, subsequently provided detailed tabulations of consumer expenditures, income, and savings (see text for series G 495–514). The Department of Agriculture, in cooperation with the Bureau of the Census, conducted a survey of farm family expenditures in 1955 (see text for series G 717–734) to obtain data to revise the Parity Index and improve the basis for estimating farm operators' production expenses, which provides detailed data on farm family expenditures.

In recent years, there have been a number of nationwide surveys of consumer expenditures by income level for specified types of goods. See, for example, individual reports in the series published by the Department of Agriculture, *Household Food Consumption Survey*, 1965–66. The reports of this survey provide detailed data for farm and nonfarm households on quantities and values of food consumed and on dietary levels by money income after taxes in the United States as a whole and in four major regions.

The Surveys of Consumer Finances, conducted annually from 1946–1971 for the Board of Governors of the Federal Reserve System by the Survey Research Center of the University of Michigan, yield data on consumer purchases of selected durable goods by income level of all "spending units" in the United States. Reports of these surveys appear in the *Federal Reserve Bulletin*.

Other national sample surveys conducted for use in marketing research have covered a very large proportion, but not all types, of consumer goods and services. The most comprehensive of these is the study of consumer expenditures conducted for Life Magazine by Alfred Politz Research, Inc., which is based on a sample designed to represent all individuals, 20 years of age and over, in conterminous United States. The study provides an unusual amount of detailed material on expenditures for commodities along with data on buying habits of households of different types.

The lack of continuity in the tables shown here which present data by income level is, at least in part, due to the fact that the coverage and definitions used in obtaining the data differ so greatly from study to study. The chief differences in population coverage and in the classification and definition of goods and services purchased are briefly specified in the tables and in the text which follows. Differences in definition primarily affect the figures on income, expenditures for housing, and for "sundries" or "miscellaneous goods and services."

The figures on income represent annual income before deduction of direct personal taxes, i.e., income, poll, and personal property, except the following, which represent annual income after deduction of taxes: Urban families in 1917–19, series G 534–553; 1944, series G 643–660; and 1950, series G 495–514 and G 623–642; and farm-operator families in 1955, series G 717–734; and urban and farm families in 1960–61, series G 602–622 and G 697–716.

Direct personal taxes, as well as indirect taxes, were generally tabulated as an item of current expenditure in the consumer expenditure surveys made before the 1930's. Since the Consumer Purchases Study of 1935–36, such taxes have been presented separately and have not been included in consumer expenditures. For the series presented here, direct personal taxes were deducted from expenditure figures in the earlier surveys, wherever possible, to insure greater comparability with the most recent surveys.

Social Security taxes paid by the worker (first collected in 1937) were treated as savings in the 1941 and 1944 surveys, and handled with personal insurance as a separate class of disbursements in the 1950 urban, the 1955 farm, and the 1960–61 urban and farm surveys.

In the early studies of wage earners' incomes and expenditures, no attempt was made to evaluate the products received by a family from its garden, poultry, hogs, or cows. Most studies of the incomes and expenditures of farm-operator families include data on the value of food and fuel produced by the family for its own use, sometimes valued at prices which would have been paid for them had they been purchased through nearby trade channels, and sometimes at prices which would have been received if the products had been sold.

The treatment of imputed income resulting from expenditures for owned homes varies considerably from one series to another. Series G 416–494 include rental value of owned homes, but not capital expenditures for housing. In the early studies of wage earners' expenditures, the statistical difficulties of handling homeowners' housing expenditures were avoided by excluding homeowners from the "normal" family group and including only renters. In studies made since the middle-1930's, emphasis has been laid on homeowners' current year expenditures for housing and for investments in their homes, but in some surveys data on rental value is also available in the original sources.

Conceptually, premiums paid on life insurance policies may be classified wholly as current expenditures or partly as savings and partly current expenditures, depending on the type of policy; but in sample surveys it is difficult to obtain from respondents information on the type of policies on which premiums are paid.

Series G 416–494 include as consumer expenditures the part of insurance premiums paid which covers the expense of handling life insurance, but not the part which will eventually be returned to the consumer buyer or his beneficiaries. In sample surveys of consumer expenditures made before the 1930's, the difficulty of obtaining information on the types of policies held resulted in classifying payments on such premiums in the sundries or miscellaneous group as current expenditures. In expenditure surveys made since 1930, it has been the practice to exclude insurance premiums from current expenditure data, handling them either as savings or as a separate class of disbursements.

Until the 1960–61 survey, farm studies included operator families only, in some cases defined to cover nonresident operators and resident operators of urban farms as well as those living on rural farms. In the 1960–61 survey, the three population groups were defined by place of residence. Farm families in that survey are limited to those living on rural farms, and include other than operator families.

G 495–581. General note.

Data on the consumption expenditures of city wage- and clerical-worker families of two or more persons were collected at irregular intervals and for a variety of purposes. Only the 1950 BLS Study of Consumer Expenditures was based on a sample representing families of all types in these occupational groups in cities of all sizes throughout the entire country. Insofar as the original publications make it possible, the figures from the earlier studies have been adjusted as to definition and classification of consumer expenditures so as to conform to those used in 1950.

See also general note for series G 495–848.

G 495–514. Consumption expenditures, in current prices, **of city** wage- and clerical-worker families of **2 or** more persons, **by** income class, **1950.**

Source: **U.S.** Department of Labor, *How American Buying Habits Change*, 1959.

These series are based on a *Study of Consumer Expenditures, Incomes and Savings; Statistical Tables: Urban U.S.—1950*, a joint study by the U.S. Bureau of Labor Statistics (BLS) and the Wharton School of Finance and Commerce, University of Pennsylvania, 1956, vols. **I, 11,111,**IX, and X.

The survey of consumer expenditures in 1950 was conducted by BLS to provide the basis for revising its Consumer Price Index (CPI). The survey was undertaken during the first half of 1951 in 91 urban areas throughout the United States ranging in size from places of 2,500 inhabitants to the greater New York area with a population of 9 million. Complete and usable reports were obtained from 12,489 consumer units Since the study was directed toward the determination of expenditure weights for the revised CPI, the data for family expenditures for individual consumption goods and services purchased by the 7,007 wage-earner and clerical-worker families of two or more persons were tabulated and averaged for each of the 91 cities surveyed.

Subsequently, the same data were tabulated in considerable detail and published as part of the study of consumer expenditures, income, and savings, which was made by the Wharton School of Finance and Commerce in cooperation with BLS under a grant from the Ford Foundation.

To obtain data for wage-earner and clerical-worker families of two or more, the following groups were excluded: Single consumers; self-employed; salaried professionals; officials, etc.; and persons not gainfully employed. Within the nine classes of cities averaged for the Wharton School publications (large cities, suburbs, and small cities in the North, South, and West), averages were based on the sample families as weights; in combining the resulting averages, universe (total consumer units, i.e., families and single consumers) weights were used.

G 515–533. Consumption expenditures, in current prices, ***of*** employed city wage- and clerical-worker families of ***2 or*** more persons, **by** income class, **1934–36.**

Source: U.S. Bureau of Labor Statistics, unpublished data.

These series are based on Faith M. Williams and Alice C. Hanson, *Money Disbursements of Wage Earners and Clerical Workers*, Bureau of Labor Statistics, Bulletin No. 638, summary volume, 1941.

The data in this 1934–36 study were gathered to provide the basis for revising the **BLS** Consumer Price Index. The survey (conducted in a period of mass unemployment) was restricted to families of two or more in large cities, who had an income of at least $500 and who had not been on public relief rolls during the survey year. These limits precluded from the pattern on which the CPI was to be based the irregular spending of workers on "relief" and those employed so irregularly that their purchases could not have been typical of long-range consumption patterns. The survey covered 12,903 white families and 1,566 Negro families in 42 cities with population 50,000 or more.

These series, derived from Bulletin No. **638,** have been adjusted for comparability with definitions and classifications of the 1950 *Study of Consumer Expenditures*. . . (see text for series G 495–514), as follows: "Vocation" outlays shown in table **1** were deducted from both "average annual current expenditures" in table **1** and from "average annual amount" of total net family income in table **7.** "Community welfare" and "gifts and contributions to persons outside the economic family" were deducted from "average annual current consumption expenditures" in table 7.

G 534–553. Consumption expenditures, **in** current **prices, of** city wage- and clerical-worker families with at least **1** child, **by** income **class, 1917–19.**

Source: U.S. Bureau of Labor Statistics, Bulletin No. 357, *Cost of Living in the United States, 1917–19.*

These data were collected from white city worker families consisting of husband and wife and at least one child, who was not a boarder or lodger. The families could have no boarders and not over three lodgers; at least 75 percent of family income had to come from the principal breadwinner or others who contributed all earnings to the family fund; slum or charity families or non-English speaking families who had been in the United States less than five years were excluded.

This survey was first undertaken in shipbuilding centers for the purpose of providing market baskets which could be used in computing consumer price indexes for cities most affected by the inflation which occurred during and just after World War **I.** It was later broadened to cover 92 cities and localities throughout the entire country.

The income and expenditure figures presented in Bulletin No. 357 were adjusted for comparability with definitions and classifications used in the 1950 *Study of Consumer Expenditures*. . (see text for series G 495–514). Thus, average money income after taxes (see series G 536) was derived by deducting dues to labor organizations, personal property and poll taxes, and expenditures for tools (Bulletin

No. 357, pp. 448 and 454) from total average income per family (Bulletin No. 357, p. 4). Average expenditures for current consumption (see series G 537) were derived by deducting from total average yearly expenses per family (Bulletin No. 357; p. 5) the same items deducted from income and, in addition, life insurance premiums; contributions to church, charity, and patriotic purposes; and gifts (Bulletin No. 357, pp. 447 and 448). Each consumption group was adjusted for maximum comparability with the corresponding groups as classified in the 1950 *Study* (when they differed from the original published table).

G 554–563. Consumption expenditures, in current prices, of normal city wage- and clerical-worker families of 2 or more persons, by income class, 1901.

Source: See source for series G 495–514.

These series are based on 18th Annual Report of the Commissioner of Labor, Document No. 23, Bureau of Labor, 1903, *Cost of Living and Retail Prices of Food,* pp. 581, 592, and 593.

Earnings and expenditure data from this report covered families with wage and salary incomes not exceeding $1,200 a year, and were collected through personal interviews by experienced special agents of the Bureau of Labor. About 15 percent of these families had incomes from boarders and lodgers and other sources. The latter income raised total income above $1,200 for a few families. Therefore their expenditures could be, and were, above $1,200. Altogether, data were collected from 25,440 families of all types but only those from the 11,156 families defined as "normal" were summarized by income levels. These "normal" families had a husband at work, a wife, not more than five children and none over 14 years of age; no dependents, boarders, lodgers, or servants; and provided data on expenditures for rent, fuel, lighting, food, clothing, and sundries.

The 1901 study had a wide city and industry coverage in 32 States and the District of Columbia, and appears to have provided a very good picture of "normal" families in wage and salaried occupations. The selection of the number of persons interviewed in each geographical area was roughly apportioned in accordance with the number of persons employed in the manufacturing industries of the States.

G 564–572. Consumption expenditures, in current prices, of normal city wage- and clerical-worker families of 2 or more persons in 9 basic industries, by income class, 1888–91.

Source: See source for series G 495–514.

These series are based on Sixth Annual Report of the Commissioner of Labor, 1890, *Cost of Production,* part III; and Seventh Annual Report of the Commissioner of Labor, 1891, *Cost of Production,* vol. II, part III. Only data for so-called "normal" families in all industries (identified by budget numbers, Seventh Annual Report, pp. 1826–1839, 1887–1898) were used for comparative purposes. Family size, income, and expenditures were tabulated from the Sixth Annual Report (pp. 790–801, 914–925, 984–989, 1076–1085, 1128–1131, 1160–1162), and the Seventh Annual Report (pp. 1170–1206, 1374–1390, and 1552–1569). Those data provided the basis for calculation of average family size, income, and total expenditures for all "normal" families by income class. The percentage distributions of total expenditures for "normal" families, in the Seventh Annual Report (pp. 2012 and 2013), were applied to the appropriate averages to estimate the dollar expenditure by income class.

Earnings and expenditure data in the study covered 2,562 "normal" families. "Normal" families had both a husband and wife, not more than five children, no one of whom was over 14 years of age; no dependents or boarders; did not own its own dwelling place; and had expenditures for rent, fuel, lighting, clothing, and food. The study covered workers in the following industries: Pig iron, bar iron, steel, bituminous coal, coke, iron ore, cotton, woolen, and glass.

G 573–581. Consumption expenditures, in current prices, of Massachusetts city wage- and clerical-worker families of 2 or more persons, by income class, 1874–75.

Source: See source for series G 495–514.

These data are based on Massachusetts Bureau of Statistics of Labor, Sixth Annual Report, March 1875, Public Document No. 31, pp. 221–354, 372, 373, and 441. The data were collected from families of wage earners in 15 cities and 21 towns by trained agents of the Bureau of Statistics of Labor who approached 1,000 families before they were able to find 397 who had enough information about their affairs to answer the questions put to them and who were also willing to "having their private life inquired into." The families included about equal numbers of skilled and unskilled workers, and were those who, with comparatively few exceptions, had children dependent on them for support.

Series G 573–581 were computed from data in the Massachusetts report which show, by income class, the number of families from whom figures were received, their aggregate earnings and expenses in each class, and percentages of expenditure as regards income, by income class, for five major categories of expense. The resulting weighted averages for all families' earnings and expenses were found to check with all family averages shown elsewhere in the report. Average figures on money earnings, expenses for all goods and services and for fuel also checked with such averages in the report. The figures on expenses for food, rent, and sundries checked within a few dollars (differences probably caused by rounding of the percentages).

In this report, the items of expenditure not specifically for subsistence, clothing, rent, and fuel were listed as sundries. The report states that sundry items of expense are those which "although . . . not absolutely necessary for the life of the body, are, in their way, imperative necessity in a man's social life." Some specified sundries include furniture, carpets, books and papers, societies, religion, charity, sickness, care of parents, care of house, recreation, housegirl, travel to work, and life insurance.

G 582–601. Consumption expenditures of city wage- and clerical-worker families of 2 or more persons, 1888–91 to 1960–61.

Source: 1888–91, 1901, and 1917–19, see source for series G 495–514. For 1934–36 and 1950, U.S. Bureau of Labor Statistics, "Standards and Levels of Living of City-Worker Families," *Monthly Labor Review,* September 1956, p. 1018. Averages for 1960–61 compiled from unpublished tabulations from the Bureau's survey of consumer expenditures, 1960–61.

Figures on average money receipts and outlays of wage and clerical-workers' families of two or more persons in large cities have been converted into dollars of 1950 purchasing power for each of the survey years since 1888–91. The BLS Consumer Price Index was used to convert current expenditures and average income into dollars of 1950 purchasing power for the surveys of 1917–19, 1934–36, and 1960–61. The cost-of-living index developed by Paul Douglas (see *American Economic Review,* Supplement, March 1926, p. 22) was used to convert income and total consumption expenditures for the 1888–91 and 1901 studies; the BLS Retail Food Index was used to convert the expenditures for food and drink. Other categories of expenditures were not converted into 1950 dollars because no indexes are available for these categories prior to 1913.

Series G 582–601 for 1917–19, 1934–36, and 1950 relate to expenditures of wage and clerical workers' families in large cities, i.e. with populations of 50,000 and over in 1917–19 and 1934–36 and 30,500 and over in 1950. For 1960–61, they relate to expenditures of wage and clerical workers' families in urban places of 2,500 and over. Populations of the large industrial centers surveyed in 1888–91 and 1901 were not specified.

G **602–696.** General note.

For discussion of the surveys from which these series were taken, see general note for series G 495–848 and the following text for certain series grouped by survey.

G **602–622.** Consumption expenditures, in current prices, of **all** families of **2** or more persons in cities of **2,500** and over, **by** income class, **1960–61.**

Source: US. Bureau of Labor Statistics, *Survey of Consumer Expenditures, 1960–61.*

The 1961 survey coverage was extended to rural areas so, for the first time since 1941, information was available on spending habits for a cross-section of the total noninstitutional population in urban and rural areas of the United States.

See also text for series G 495–514 and series G 798–812.

G **623–642.** Consumption expenditures, in current prices, of **all** families of **2 or** more persons in cities of **2,500** and over, **by** income class, **1950.**

Source: *Study of Consumer Expenditures, Incomes and Savings; Statistical Tables: Urban U.S.—1950,* cited in text for series G 495–514, vol. XVIII, pp. 14–23.

For a description of this survey, see text for series G 495–514. To obtain the data for all families of two or more persons, only single consumers were excluded; all occupational groups were included. Within the nine classes of cities averaged for the Wharton School publications (large cities, suburbs, and small cities in the North, South, and West), averages were based on the sample families as weights. In combining the resulting averages, universe (total consumer units) weights were used.

G **643–660.** Consumption expenditures, in current prices, **of** all families of **2** or more persons in cities of **2,500** and over, **by** income class, **1944.**

Source: U.S. Bureau of Labor Statistics, *Monthly Labor Review,* January 1946, p. 4; and Bulletin No. 838, *Wartime Food Purchases,* pp. 1–4 and appendix.

A study of expenditures and savings in 1944 of city families was undertaken by BLS for the primary purpose of comparing prices reported by city consumers with prices indicated by urban store reports. The survey was made in two parts. The first part, made in the fall of 1944, provided detailed information on food purchases during one week, purchases of clothing and household textiles during the first eight months of the year, tenure and rental in August 1944, and sufficient information on family composition, living arrangements, and income to provide a basis for classification. The second part provided data on purchases of food during one week early in 1945, of clothing and other textiles during the last four months of 1944, and of other goods and services throughout 1944.

The sample used in this survey was very similar to that used in the 1941 survey (see text for series G 661–678) and related to the civilian noninstitutional population in cities of 2,500 or more scattered throughout the country. The sample included approximately 1,700 families and single persons in 28 metropolitan districts and 20 cities with a population under 50,000 outside of metropolitan districts. These places were selected to represent, with respect to region, State, and city size, all cities in the United States with a population of 2,500 or more.

Family income represents the sum of all types of income received by family members during 1944; included are wage and salary earnings after payroll deductions of income taxes, entrepreneurial net income or withdrawals, and nonearned income from all sources except inheritances, large gifts, and lump-sum insurance settlements,

Although the figures were originally published as preliminary and subject to slight revisions, no revisions were subsequently issued.

G **661–678.** Consumption expenditures, in current prices, of **all** families of **2** or more persons in cities **of** 2,500 and over, **by** income class, **1941.**

Source: U.S. Bureau of Labor Statistics, Bulletin No. **822,** *Family Spending and Saving in Wartime,* pp. 68, 70, 71, 76,102, and 109.

The survey of family spending and saving in wartime (World War 11) is the only survey which was conducted for the primary purpose of providing national estimates of expenditures and savings by income class.

The method of drawing the sample used for this survey differed in several important respects from that followed in earlier surveys of family incomes and expenditures. A description of these changes appears in part I, "Scope and Method," of the source. The coverage of population was more complete than in any previous survey and included such segments of the population as families on public relief rolls, foreign-born and broken families, single consumers, occupational groups, and city-size classes; but it excluded inmates of institutions, residents of military camps, and persons in labor camps.

The sample was smaller than in any previous survey on which national estimates have been based. The sample for urban areas covered about 1,300 families and single persons in 62 cities of **2,500** or more scattered throughout the country. The cities were so selected as to give proper representation to **(1)** each city-size group: **(2)** proximity to a metropolis (for cities under 50,000); **(3)** each region and State; (4) low, medium, and high rent cities; and (5) cities of differing racial composition.

Information was obtained on both money and nonmoney income, although only money income figures are shown here. Expenditures for family living were reported in detail under **14** categories of expense. All purchases of durable goods made during the year, except payments on homes and improvements on homes, were considered current expenditures. Financing charges, interest on installment and other credit purchases, and shipping and delivery charges were considered as part of the expenditure. Discounts and trade-in allowances were deducted from the gross price. Sales and excise taxes were included in the expenditure for each article except in the case of the details for food expenditure.

Sample data for the $5,000 to $10,000 and the $10,000 and over classes are included, although the averages for these classes are based on a small number of cases and are therefore quite irregular and subject to a wide margin of error. They should be considered as statements of sample results only, and not as estimates of actual expenditures by the entire group of families in those income groups.

G **679–696.** Consumption expenditures, in current prices, **of all** families **of 2** or more persons in cities of **2,500** and over, **by** income class, **1935–36.**

Source: **U.S.** National Resources Planning Board, *Family Expenditures in the United States, Statistical Tables and Appendixes,* 1941, pp. 61, **120,** and 157.

The study of family expenditures is part of the *Study of Consumer Purchases,* conducted by the Bureau of Labor Statistics and the Bureau of Home Economics, in cooperation with the National Resources Committee, the Central Statistical Board, and the Works Progress Administration. The Bureau of Home Economics conducted the survey in rural-farm and rural-nonfarm areas and in the majority of the small cities covered, and the Bureau of Labor Statistics conducted the surveys in the other small cities and all of the larger urban communities.

The study of consumer purchases was the 'most detailed analysis of family expenditures in the United States made up to that time. Data were published on over 90 categories of outlays. They **are**

classified to permit study of differences between the farm, rural-nonfarm, and urban population, of regional variations, of differences with respect to size of family and between white and Negro families, as well as of differences between income levels.

Detailed information on expenditures and savings during a 12-month period between January 1935 and December 1936 was secured from a sample of about 60,000 families living in cities of different sizes, in villages, and on farms in 30 States, of which 54,000 were used in preparing the family expenditure data. The urban sample covered 51 cities and approximately 30,000 expenditure schedules. Both the sample expenditure data and the population weights used in preparing the estimates (shown in these series) of family expenditures by income class exclude families receiving any direct or work-relief assistance (however little) at any time during the year.

Income was defined to include total net money income received during the year by all members of the economic family, plus the value of certain items of nonmoney income such as net value of owner-occupied homes and rent received as pay. Consumption data were collected only from native white families in most sample communities and from native Negro families in the Southeast, in New York City, and Columbus, Ohio.

G 697–797. General note.

For discussion of the surveys from which these series were obtained, see general note for series G 495–848 and the following text for series grouped by survey.

G 697–716. Consumption expenditures, in current prices, of farm families of **2 or** more persons, by income class, 1961.

Source: U.S. Department of Agriculture, Consumer Expenditure Survey Report No. 20, *Consumer Expenditures and Income, Rural Farm Population,* United States, 1961, p. 6.

These data are from a cooperative undertaking of the U.S. Bureau of Labor Statistics and the U.S. Department of Agriculture in which the USDA had responsibility for the farm population. They are based on a sample of 1,967 families and single consumers in 41 States selected by a three-stage sampling technique utilizing stratification of counties by State Economic Areas.

Classification is by income from which Federal, State, and local personal taxes and occupational expenses have been deducted. The value of food and rent received as pay are included in both income and expenditures. The rental value of dwellings rented by farm operators and the share of ownership expenses (taxes, insurance, and mortgate interest payments) attributed to the family dwelling by farm owners are included in shelter expenses and deducted from farm operating expenses. Shelter also includes expenses for lodging away from home and for vacation homes. Automobile expenses include the estimated family share of cars and trucks also used on the farm or other business. Expenditures for other goods and services include expense for funerals of family members, legal fees, bank charges for service and deposit box, rental of post office box, money lost or stolen, interest paid on borrowings for family use, poll taxes, and personal property taxes.

In addition to the data shown in these series, data have been published on net change in assets and liabilities; disbursements for gifts, contributions, and personal insurance; the value of food produced for home use; and the value of food, shelter and other items received without direct expenditure.

G 717–734. Consumption expenditures, in current prices, of farm families of 2 or more persons, **by** income **class,** 1955.

Source: Derived from U.S. Department of Agriculture, Statistical Bulletin No. 224, *Farmers' Expenditures in 1955 by Regions,* 1958, and from unpublished data of the Agricultural Research Service.

These data are based on a weighted sample of approximately 4,000 schedules, selected on the basis of the 1954 Census of Agriculture distribution of farms by economic class of farm (value of all products sold). The number of families included a small number not reporting income. Federal and State personal taxes have been deducted from money income. Expenditures for dwelling upkeep included, for owned homes, an assigned share of real estate taxes and special assessments, insurance premiums, mortgage interest charges, legal and settlement charges; and, for both owned and rented homes, expense for repairs, replacements, alterations and improvements, and cash rent for off-farm rented dwellings. Expense for lodging away from home and for vacation homes was also included. Expenditures for automobile and truck transportation include family share of purchase and upkeep. Expenditures for other goods and services include expense for funerals for family members, legal fees, bank charges for service and deposit box, rental of post office box, money lost or stolen, interest paid on borrowing for family use, occupational expense, union dues, poll taxes, and personal property taxes.

G **735–753.** Consumption expenditures, in current prices, of farm families of **2** or more persons, **by** income class, 1941.

Source: U.S. Department of Agriculture, Miscellaneous Bulletin No. **520,** *Rural Family Spending and Saving in Wartime,* June 1943, pp. 156 and 159.

These data were obtained from a study conducted in 1942 by the Bureau of Home Economics in areas representing the entire rural population of the country. The survey was paralleled by a study of the income and expenditures of urban families and single consumers conducted by the Bureau of Labor Statistics (see text for series G 661–678). The study was based on a sample of 1,000 rural-nonfarm families and single consumers and 760 farm families and single consumers in 45 counties, stratified to give representation to all regions and to economic groups in the rural population.

The data collected included nonmoney as well as money income; the former was limited to that received in the form of food, housing, fuel, ice, clothing, or household furnishings. However, classification in these series is by money income only. Expenditures for family living were reported in detail under 15 categories of expense. All purchases of durable goods made during the year, except payments on homes and improvements on homes, were considered as current expenditures. Financing charges and interest on installment and other credit purchases, shipping and delivery charges were considered as part of the expenditure. Discounts and trade-in allowances were deducted from the gross price. Sales and excise taxes were included in the expenditures for each article except in the case of the details for food expenditure. Although the survey included expenditures of families and single consumers, these series cover farm families only.

G 754–771. Consumption expenditures, in current prices, of farm families, by income class, 1935–36.

Source: U.S. National Resources Planning Board, *Family Expenditures in the United States, Statistical Tables and Appendixes,* June 1941, pp. 51, 120, and 157.

These data are based on information obtained as part of the Works Progress Administration study (see text for series G 679–696) and summarized for the United States by the National Resources Planning Board. The definition of income used in this study includes, in addition to money income, the nonmoney income items of net rental value of owner-occupied homes and housing received as pay and the net imputed value of food produced at home for the family's own use. For farm families, it also includes the net imputed value of certain other farm-produced goods used by the family, i.e., fuel, ice, tobacco, and wool, plus or minus the value of any increase or decrease in the amount of livestock owned or of crops stored for sale.

Estimates for approximately 15,000 native farm families (excluding those on public relief rolls) living in rural areas are presented in these series. For the main categories of disbursement, 140 villages and 66 farm counties in 30 States were surveyed. The farm sample represents the more important types of farming. Farm families operating part-time farms were excluded from the consumption sample (except in Oregon).

G 772–777. Consumption expenditures, in current prices, of farm families, by income class, **1929.**

Source: Computed from M. Leven, H. G. Moulton, and C. Warburton, *America's Capacity to Consume*, The Brookings Institution, Washington, D.C., 1934, p. 260 (copyright).

Aggregates presented in the original source were divided by the number of families in each income class to derive average expenditures per family.

The number of families is based on the distribution of families by income estimated by Maurice Leven. The estimates of consumer expenditures were made by Clark Warburton on the basis of six sample studies of the value of consumer goods and services used by farm families in one year between 1924 and 1930.

The income figures shown here represent both annual money and nonmoney income. Included in nonmoney income are imputed value of home-produced food and fuel, and of owned homes. The expenditure for "other" items includes direct taxes and contributions.

G 778–797. Consumption expenditures of farm families, by income class, **1922–1924.**

Source: Computed from E. I. Kirkpatrick, *The Farmer's Standard of Living: A Socio-Economic Study of 2,886 White Farm Families of Selected Localities in 11 States*, U.S. Department of Agriculture, Bulletin 1466, pp. 29 and 34.

These data were derived from a number of special studies made by the Department of Agriculture in cooperation with 12 colleges or universities. The studies were planned to show the following items among others: Tenure, acres per farm, and value of land per acre; quantities and value of food, fuel, and other materials furnished during the year; quantities and costs of food, fuel, furniture and furnishings, household supplies, and household labor purchased during the year; and expenditures for other items such as clothing, health, education, recreation, personal care, etc.

The economic level of farm business resources and of farm family living was the chief consideration in the selection of the localities represented in this study. The localities were situated in 11 States (New Hampshire, Vermont, Massachusetts, Connecticut, Kentucky, South Carolina, Alabama, Missouri, Kansas, Iowa, and Ohio). Of the 2,886 families represented in the study, 1,950 were owners, 867 were cash and share tenants including croppers, and 69 were hired men or managers. The study was limited to families who had an adult man operating the farm and an adult woman as homemaker; generally the operator and homemaker were man and wife.

Total expenditures for current consumption and expenditures for each consumption category were derived from figures in the source showing percentage distribution of the value of all goods. Expenditures for life and health insurance were deduced from the total. Consumer goods and services purchased include food, fuel, and housing furnished by the farm. Food and fuel provided by the farm were valued at prices halfway between what they would have brought and what they would have cost in the open market; housing provided was valued at 10 percent of the estimated value of the house occupied.

The class intervals shown in series G 778–797 as value of goods purchased and goods furnished in kind are ambiguously referred to in the original as "total value or income" groups. A comparison with other studies by the author indicates that the classes are not representative of income. Series G 778–797 therefore differs in this respect from the other series in this chapter.

G 798–848. General note.

For discussion of the surveys from which these series were obtained, see general note for series G 495–848 and the following text for series separately grouped by survey.

G 798–812. Consumption expenditures, in current prices, of families and single consumers combined, by income class, **1960–61.**

Source: U.S. Bureau of Labor Statistics, *Consumer Expenditure and Income Survey—Total United States, Urban and Rural*, Report No. 237–93, 1965.

About 73 percent of the families in the universe for the 1960–61 survey lived in urban places, 21 percent in rural nonfarm areas, and 6 percent in rural farm areas of the 50 States and the District of Columbia. The urban segment includes persons living in incorporated or unincorporated areas of 2,500 population or more and in densely settled areas immediately adjacent to cities of 50,000 population or more. The rural population is subdivided into the rural-farm population, which constitutes all rural residents living on farms, and the rural-nonfarm population, composed of the remaining rural population.

The survey was planned to represent a year's income, expenditure, and saving experience of all noninstitutional consumer units living in the United States (including military posts, camps, reservations, homes for the aged, asylums, jails, and similar "long stay" institutions).

G 813–827. Consumption expenditures, in current prices, of families and single consumers combined, by income class, **1941.**

Source: See source for series G 661–678, p. 75.

For a description of this study, see text for series G 661–678 and G 735–753.

The expenditure data in these series represent expenditures of all families and single consumers including families with negative incomes and incomes of $5,000 and over not shown separately, for the country as a whole. Nonmoney income is not included. The expenditure patterns are based on a sample of 3,100 families and single consumers in 62 cities and 45 rural counties.

G 828–842. Consumption expenditures, in current prices, of families and single consumers combined, by income class, **1935–36.**

Source: U.S. National Resources Committee, *Consumer Expenditures in the United States, Estimates for 1935–36*, pp. 77 and 84.

The study from which these series were derived was part of the Works Progress Administration study already described in the text for series G 679–696 and G 754–771, supplemented by data from other sources on expenditures of families with foreign-born heads, and of families having received public relief assistance. The expenditure data were secured from a sample of more than 60,000 families living in cities of different size, in villages, and on farms in 30 States. Similar patterns for single men and women were built up from less extensive sample data available from the study of Consumer Purchases and from various supplementary sources. Average consumption patterns for broad groups of the population and for the Nation as a whole were obtained by weighting the patterns for the component groups of families and single individuals according to their relative importance at each income level. The population weights for this purpose and for estimating the aggregate consumption of the Nation in 1935–36 were derived from the study of consumer incomes (see National Resources Committee, *Consumer Incomes in the United States, Their Distribution in 1935–36*).

G 843–848. Consumption expenditures, in current prices, of families and single consumers combined, by income class, 1929.

Source: Computed from M. Leven, H. G. Moulton, and C. Warburton, *America's Capacity to Consume,* The Brookings Institution, Washington, D.C., 1934, pp. 260, 261, and 265 (copyright).

For the purpose of presenting these series in a form roughly comparable with those from other sources for earlier years, average consumption expenditures of all families and single consumers were derived by combining aggregate consumption expenditures (in millions of dollars), by income class, of farm and urban families and single consumers, as given in the report, and dividing these by the total number of consumers (in thousands) in each income class.

The estimates of consumer expenditures presented in *America's Capacity to Consume* were made by Clark Warburton who based his figures on sample surveys of expenditures of nonfarm families for 1918–1930, of farm families for 1924–1930 (see text for series G 772–777), and of single persons for 1918–1933 from a variety of sources. In addition, he used the results of a questionnaire concerning incomes, expenditures, and savings in 1929 circulated hy The Brookings Institution to families of business and professional men.

G 849. Index of volume of food marketings and home consumption, 1910–1970.

Source: U.S. Department of Agriculture, Economic Research Service, *Farm Income Situation,* July 1971, *Agricultural Statistics, 1971,* and unpublished data.

This index was derived for various time periods by weighting the quantities of the major farm-produced foodstuffs sold or used in farm households by average farm prices. The following average prices were used: For 1910–1939, prices for 1935–1939; for 1940–1955, prices for 1947–1949; for 1956–1970, prices for 1957–1959. The series were "spliced" on the basis of overlapped calculations for 1940 and 1955. This index, as well as others including nonfood commodities, is described in *Major Statistical Series of the U.S. Department of Agriculture,* Agriculture Handbook No. 365, vol. 2, pp. 17–19.

G *850.* Index of food consumption per capita, 1909–1970.

Source: U.S. Department of Agriculture, Economic Research Service, *National Food Situation,* February 1971; and *Food Consumption, Prices, and Expenditures,* Agricultural Economics Report No. 138, and supplements.

This index was derived by weighting per capita consumption of food, retail weight equivalents, by average retail prices in 1957–1959. Details of the construction of this index are described in *U.S. Food Consumption—Sources of Data and Trends,* 1909–63, Statistical Bulletin No. 364. The retail weight data were derived from such series as those on per capita food consumption, series G 881–915, by means of average conversion factors for nonprocessed and partially processed items which allow for waste and losses in distribution between the particular primary distribution level at which each series is measured and the retail store level.

This index measures, primarily, changes in quantity, although it also reflects certain changes in quality of foods consumed, such as the shift from lower-priced to higher-priced foods. It does not reflect price changes as such, because base-period prices are used throughout.

G 851–856. Nutrients available per capita, per day, 1909–1970.

Source: See source for series G 850.

These figures are averages for the total population, 1909–1940, and for the civilian population only, 1941–1970. Data were computed on the basis of estimates of apparent civilian consumption (retail basis) including estimates of consumption from home gardens. No deductions were made in the nutrient estimates for the loss or waste of food in the home or for the destruction or loss of nutrients during the preparation of food. Deductions were made for inedible refuse.

The computations were made by multiplying the estimated per capita quantity of each food consumed by appropriate food composition figures. The composition values are those published in Department of Agriculture, *Composition of Foods. . , Raw, Processed, Prepared,* Agriculture Handbook No. 8, supplemented by a few unpublished values.

Since the early 1940's, there has been enrichment or fortification of several types of foods with minerals and vitamins. Included here are estimated quantities of iron, thiamine, riboflavin, and niacin added to flour and cereal products; quantities of vitamin A value added to margarine and milk of all types; and quantities of ascorbic acid added to fruit juices and drinks.

The consumption of vitamins and mineral preparations, other than those used in the enrichment or in the fortification of foods, is not included here. Quantities of calcium or other minerals added to flour to make it self-rising or phosphated are not included nor is the nutritive content of baking powder, yeast, or dough conditioner.

G 857–865 and *G* 866–880. General note.

Surveys of household food consumption provide information about the kinds and quantities of food that families with different characteristics eat, as well as the amount of money they spend for food. Dietary levels of different groups within the population are then computed from the nutrient content of the reported food. The results are used by Congress and Federal agencies to develop and administer programs and policies related to food, by the food industry for information on needs and wants of consumers, and by educators and others to assess the nutritional situation and to develop programs for improving nutritional levels in the United States.

The survey data presented here are limited to housekeeping households in the spring of the survey year. Housekeeping households are those with at least one person eating 10 or more meals from household food supplies during the preceding seven days.

The Department of Agriculture has made five nationwide surveys of food consumption over the past 35 years—in 1936, 1942, 1948 (urban only), 1955, and 1965. The 1955 and 1965 surveys were more comprehensive than their predecessors. Both obtained information on patterns of food consumption, expenditures, dietary levels, and household food practices. Data for households were classified (1) by regions—Northeast, North Central, South, and West (according to Census of Population classifications); (2) by urbanization—rural farm, rural nonfarm, and urban, within regions; and (3) by several household income classes within region-urbanization categories. The 1936, 1942, 1948, and 1955 surveys covered only the spring. The 1965–66 survey covered the four seasons, but only data for the spring are shown here.

G 857–865. Nutritive value of city diets—average per person per day from food used at home: 1936, 1942, 1948, 1955, and 1965.

Source: H. K. Stiebeling, D. Monroe, E. F. Phipard, and others, 1936, *Consumer Purchases Study. (Urban and Village Series.) Family Food Consumption and Dietary Levels.* Five Regions. U.S. Department of Agriculture (USDA) Miscellaneous Publication 452; U.S. Bureau of Human Nutrition and Home Economics, 1942, *Family Food Consumption in the United States, Spring 1942.* USDA Miscellaneous Publication 550; 1948, *Nutritive Value of Diets of Urban Families, Spring 1948 and Comparison With Diets in 1942.* USDA 1948 Food Consumption Surveys, Preliminary Report No. 12; 1955, *Dietary Levels of Households in the United Slates.* USDA Household Food Consumption Survey 1955, Report No. 6. 1965, U.S. Department of Agriculture, *Dietary Levels of Households in the United States, Spring 1965,* Report No. 6.

Nutritive value data from the surveys relate only to urban housekeeping households for the spring in each year. Data for 1936,

1942, 1948, and 1955 exclude single person households; 1965 data include them, but they have only a minor effect on the average use of most foods. The number of persons in a household is the number of household meals divided by 21, the theoretical number of meals eaten by one person during a week. Thus a person eating 14 meals at home and 7 meals away is counted as .67 person.

G 866-880. Food used at home—average annual income, household size, and quantity of food per person per week: **1942, 1948, 1955,** and **1965.**

Source: See source for series G 857–865.

See general note for series G 857–865 and G 866–880.

G 881-915. Apparent civilian per capita consumption **of** food, **1849–1970.**

Source: See source for G 850.

Department of Agriculture estimates of the consumption of major foods are based on a great variety of information pertaining to supplies moving through trade channels for use by the civilian population. All estimates for foods other than cane and beet sugar are derived from data obtained primarily for other purposes. This accounts **(1)** for the lesser degree of reliability which should be placed on data in many of the series for earlier years, particularly before 1924 and **(2)** for the several levels in distribution at which the official estimates of consumption of individual foods are measured.

From the annual supply of each food (production plus beginning stocks, plus imports) are deducted feed, seed, industrial, and other nonfood use, exports and shipments, government purchases, and ending stocks. The residual is taken as a measure of the quantities moving into domestic civilian consumption during a given calendar year. Data used are from the following sources:

Item	*Source of data*
Stocks	U.S. Department of Agriculture, Statistical Reporting Serv'ce: U.S. Department of Commerce. trade reports.
Production	Statistical Reporting Service; National Marine Fishery Service.
Foreign trade	Department of Commerce; Statistical Reporting Service.
Nonfood use	Statistical Reporting Service.
Military procurement	Special reports submitted to Department of Agriculture.

Data on military takings during World War I were so incomplete that they could not be used. Accordingly, data on total domestic food "disappearance" for 1909–1940 were divided by the total population. For 1941–1970, the total food supplies available for civilian consumption were divided by the number of people eating from civilian supplies. For 1941–1945, adjustments were made for members of the Armed Forces who were on leave or were, for other reasons, eating in homes or restaurants in this country.

The basic disappearance data are in varied terms, such as the carcass weight of meats at the slaughter level and the farm weight of fresh fruits and vegetables. However, such variation does not impede comparisons for a given food through time. Although disappearance data are not the same as consumption data, since they measure the quantities of food going into the distribution system instead of the quantities bought or consumed by consumers, they are the only available estimates of consumption. All disappearance data are on a national basis and no regional or State estimates can be made without the collection of much additional statistical information.

Some scattered data that are basic to estimates of apparent consumption have been gathered from decennial censuses prior to 1900. The food production data from the Census of Agriculture for 1910 were more complete, and are the first important benchmark for most food consumption estimates. The completeness and accuracy of the data have been greatly improved as the crop reporting system has developed.

Extensive descriptions of methodology, sources, and inherent limitations for all series are given in *U.S. Food Consumption . . .* (cited in the text for series G 850) and are summarized in *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 365, vol. 5.

G 881-884, meat. Consumption is measured at the wholesale level in terms of weights of dressed carcass, excluding offal. Carcass weight of pork includes head meat, but excludes cuts rendered into lard. Quantities slaughtered under the Emergency Government Relief Purchase Program in 1934 and 1935 are included.

G 886, total fats and oils. Data are measurements at wholesale level and include fat content of butter, margarine, lard, shortening, and "other edible fats and oils" (those used in cooking and salad oils and for minor uses such as fish canning, etc.).

G 890, fresh fruit. Consumption is measured at the farm level. Includes apples (from commercial areas only, 1934–1970), apricots, avocados, bananas, cherries, cranberries, **figs,** grapes, nectarines, papayas, peaches, pears, pineapples, plums and prunes, strawberries, and citrus fruits. Excludes supplies used in processing.

G 891, citrus fruits. Includes oranges, tangerines, lemons, limes, and grapefruit.

G 893, canned fruit. Includes apples and applesauce, apricots, berries, cherries, cranberries, figs, fruit salad and cocktail, peaches (including spiced), pears, pineapple, plums and prunes, olives, citrus segments, and, beginning 1956, chilled fruit sections and salads. Data in terms of net weight reflect disappearance from the wholesale level of distribution.

G 894, canned fruit juice. Consumption is measured at wholesale level. It includes grapefruit, orange, blended citrus and lemon juices (single strength juices, 1930–1970; concentrated juices converted to single strength basis, 1941–1970), and apple, berry, fruit nectars, grape, pineapple, prune, tangerine juices, and, beginning 1955, chilled citrus juices. Prior to 1928 only grape juice was covered.

G 895, dried fruit. Includes apples, apricots, dates (pits-in basis), figs, peaches, pears, prunes (excluding quantities used for juice), and raisins and currants. Disappearance or consumption since 1941 has been measured at the wholesale level.

G 896, frozen fruits and fruit juices. Includes blackberries, blueberries, raspberries, strawberries, other berries, apples, apricots, cherries, grapes and pulp, peaches, citrus juices (product weight), and miscellaneous frozen fruits. Disappearance is measured at the wholesale level.

G 897, potatoes. Consumption is measured at the farm level. It excludes quantities supplied by nonfarm home gardens and quantities frozen or canned because they are counted in processed form, but includes quantities used for other purposes, such as for potato chips.

G 898, sweetpotatoes. Consumption is measured at the farm level. It excludes quantities canned and supplies from nonfarm home gardens.

G 899, fresh vegetables. Consumption is measured in terms of farm weights at the farm level, and includes tomatoes, artichokes, asparagus, lima beans, snap beans, broccoli, brussels sprouts, cabbage, carrots, kale, lettuce and escarole, green peas, peppers, spinach, beets, cauliflower, celery, corn, cucumbers, eggplant, garlic, onions and shallots, and minor vegetables. Beginning 1968, beets, green peas (in shell), kale, and lima beans are included in minor vegetables. It excludes quantities produced in home gardens and all supplies going into commercial processing.

G 900, canned vegetables. Excludes soups, baby food, and baked beans; but includes asparagus, lima beans, snap beans, carrots, peas, pumpkin and squash, spinach, tomatoes, tomato catsup and chili sauce, paste and sauce, and pulp and puree, tomato and other vegetable juices, beets, corn, pickles, sauerkraut, potatoes, sweetpotatoes, miscellaneous greens, pimientos, and mixed vegetables. Information on January 1 stocks was not available before 1943. Disappearance measured at wholesale level.

G 901, frozen vegetables. Includes asparagus, snap beans, lima beans, carrots, peas, pumpkin and squash, broccoli, brussels sprouts,

spinach, cauliflower, corn (cut basis), rhubarb, potato products, and miscellaneous frozen vegetables. Disappearance measured at wholesale level.

G 902, melons. Consumption is measured at the farm level and includes watermelons, cantaloups, and honeydew and honey-ball melons. Excludes quantities produced in home gardens.

G 903, dry beans. Disappearance is measured at the farm level, includes quantities used for canned baked beans and soups, and excludes supplies produced in home gardens.

G 904, total milk for human consumption. The total is measured in terms of whole milk equivalent, on fat solids basis, of all dairy products.

G 905, fluid milk and cream. Includes fluid cream on a whole milk equivalent basis (about 4 percent butterfat) and covers fresh use only; excludes fluid skim and buttermilk.

G 906, condensed and evaporated milk. Evaporated milk is unskimmed, unsweetened, case goods; the condensed milk is unsweetened (plain condensed), unskimmed bulk goods; and sweetened condensed milk, unskimmed, case and bulk goods. Data are measured at the processing level.

G 907, cheese. Includes all whole and part whole milk cheeses; excludes cottage, pot, and bakers' cheese and full-skimmed American.

G 908, ice cream. Data measured at the processing level in terms of product weight. Figures exclude frozen dairy product desserts such as sherbet, frozen custard and malted, and ice milk and mellorine (which is made from skim milk products and vegetable fats).

G 909, eggs. Consumption is measured at approximately the wholesale level of distribution and includes all eggs used in processed foods. Eggs were assumed to weigh approximately 1.5 pounds per dozen through 1946. To adjust for the increasing size of eggs, this factor was increased, beginning in 1947, by 0.01 pound each year through 1952, continued at 1.56 for 1953–1956, and raised to 1.57 in 1957.

G 910, chicken and turkey. Consumption is measured at the wholesale level. The entire series is on a ready-to-cook basis, which includes the weight of giblets. Prior to 1947, the factor used to derive ready-to-cook weight from dressed weight for chicken was 0.75; for turkey, 0.824; beginning in 1947, data were computed using differing factors for the various items of supply and distribution.

G 911, sugar, cane and beet. Represents sugar used for all purposes, including quantities in processed fruit and vegetable items and ice cream. Data for 1875–1908 were obtained from Henry Schultz, *Theory and Measurement of Demand* (based on data in *Concerning Sugar,* a looseleaf service by United States Sugar Manufacturers Association, which had been derived from Willett and Gray, *Weekly Statistical Sugar Trade Journal).*

G 912, wheat flour. Includes white, whole wheat, and semolina flour (which is used primarily for macaroni and spaghetti); excludes use in breakfast cereals, but includes use in all other processed foods.

G 913, corn flour and meal. Estimates are based on census data. Approximately 50 percent of cornmeal is degermed.

G 914, peanuts. Excludes quantities crushed for oil; includes commercially cleaned and shelled peanuts plus quantities used on farms and farm sales for food use.

G 915, coffee. Consumption is measured in terms of greenbean equivalent of all types of coffee, reflecting disappearance from the wholesale roasting level.

More Recent Data for *Historical Statistics* Series

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the ***Statistical Abstract of the United States,*** beginning with the **1975** edition. For direct linkage of the historical series to the tables in the ***Abstract,*** see Appendix I in the ***Abstract.***

Series G 416-469. Personal Consumption Expenditures, by Type of Product: 1929 to 1970

[In millions of dollars]

Series No.	Products	1970	1969	1968	1967	1966	1965	1964	1963	1962	1961
416	Total	517,644	579,457	536,178	192,066	466,334	432,839	401,221	374 982	355,057	335,152

[1] Includes smoking supplies.
[2] Includes rent of transient accommodations.
[3] Excludes practical nurses.
[4] Includes death expenses.
[5] Accident, health, and prepayment. 1909-1927, estimated at 11 percent of life insurance expenditures.
[6] Includes expenditures for automobile parts, repair, and maintenance, gasoline and oil, luggage, and 1909-1927 for horse-drawn vehicles and equipment, and blacksmiths' services.
[7] Figures differ from comparable estimates shown in series H 878. See text for series H 878–893 for explanation.

[1] Estimated number of families, in thousands, represented by sample.
[2] The cost of living index developed by Paul Douglas (*American Economic Review* Supplement, March 1926, p. 22) was used to convert the 1888-91 and 1901 expenditures into 1950 dollars. The Consumer Price Index of the Bureau of Labor Statistics was used for the surveys thereafter.
